SELECTED WATER RESOURCES ABSTRACTS

VOLUME 9, NUMBER 24
DECEMBER 15, 1976

W76-12676 -- W76-13200
CODEN: SWRABW

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

cretary of the U.S. Department of the Interior has de-
d that the publication of this periodical is necessary in the
tion of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

LIBRARY OF THE UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD III

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

MATHEMATICAL MODEL FOR FLOOD-WAVE FORECASTING BY MEANS OF WARNING BASINS,
Institutul de Meteorologie si Hidrologie, Bucharest (Rumania).
For primary bibliographic entry see Field 4A.
W76-12829

THE SIMPLIFIED INTEGRAL MATHEMATICAL MODEL ON A SMALL LOW-LAND CATCHMENT,
Technical Univ. of Warsaw (Poland). Inst. of Environmental Engineering.
M. Ozga-Zielinska, and K. Krajewski.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 129-137, March 1976. 2 fig, 8 ref.

Descriptors: *Mathematical models, Mathematics, Infiltration, *Model studies, Evapotranspiration, *Basins, Hydrology, Seasonal, Groundwater movement, Groundwater flow, Snowmelt, Surface runoff, Winter, Structures, Summer, *Watersheds(Basins).
Identifiers: Lumped-parameter model.

A model was developed for a small lowland catchment considered to be homogeneous and consequently allowing the adoption of a lumped-parameter model. It incorporated all the most important hydrological processes occurring in the catchment: evapotranspiration, infiltration, groundwater flow, surface runoff, and snowmelt. Each of these processes was modelled separately; the parameters expressing the given process in descriptive terms resulted from the effect of the optimization of the functions with a specific objective. Nonstationarity of the system was taken into account by dividing the year into two periods, a winter and a summer season. The conditions of the run of some hydrological processes were highly variable and, consequently, the process of infiltration and surface runoff had been identified separately for each period on two occasions. (Roberts-ISWS)

MATHEMATICAL MODEL OF THE 'RESERVOIR' TYPE DESIGNED FOR FLOOD-WAVE MODELLING AND FORECASTING,
Institutul de Meteorologie si Hidrologie, Bucharest (Rumania).
I. Serban.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 139-147, March 1976. 3 fig, 3 tab, 4 ref.

Descriptors: *Mathematical models, *Reservoirs, Flood waves, *Forecasting, *Rainfall, Equations, Basins, Evaporation, Unit hydrographs, Evapotranspiration, Discharge(Water), Mathematical studies.
Identifiers: *Flood wave modelling, *Derived model, Discharge conversion, Modulation function, Production function, Discharge hydrograph, Model parameters, Model implementation, Conversion.

The mathematical model was derived to achieve the rainfall/discharge conversion by means of two individual equations: a production function and a modulation function. Through the production function, the rainfall, P, over a basin was converted into effective rainfall, which became available for runoff. The conversion was achieved by means of a number of reservoirs, NS, each of which could store a maximum amount of water. The total range of reservoir numbers was a parameter that had to be optimized. A parameter defined as the maximum storage capacity of the reservoir was introduced. Evaporation, E, from the first reservoir was taken as a potential value, and the evaporation of the second reservoir in the series was taken after the depletion of the first one and multiplied by a parameter CE, of value less than unity. When the second reservoir in turn became depleted, the rate of evaporation from the third one was taken as multiplied C(E squared), and so on. The potential evaporation was multiplied by a parameter RT and compared with rainfall. When the rainfall exceeded evaporation, runoff was supplied after seepage and reservoir capacity had been exceeded. The hyetograph of the effective rainfall was transformed into a duration discharge hydrograph by using a modulation unit hydrograph which was determined by the gamma distribution function. A continuous period of observations for at least five years was necessary. The observations included rainfall, evapotranspiration, and discharge estimates, excluding baseflow. (Roberts - ISWS)
W76-12979

AN ADAPTIVE IDENTIFICATION AND PREDICTION ALGORITHM FOR THE REAL-TIME FORECASTING OF HYDROLOGICAL TIME SERIES,
International Inst. for Applied Systems Analysis, Laxenburg (Austria).
A. Szollosi-Nagy.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 163-176, March 1976. 7 fig, 2 tab, 24 ref.

Descriptors: *Time series analysis, *Algorithms, *Forecasting, Hydrology, Equations, Mathematical studies, Stochastic processes, Computers, Water quality, Variability, Water resources development.
Identifiers: *Hydrological time series, *Real-time forecasting, Data window, Noise variance, Variance, Recursive algorithms, Sequential prediction.

The state space formulation of hydrological/water resources systems was outlined. Prediction algorithms were proposed which satisfied the requirements of suitable prediction schemes by using time domain formulation. These avoided the usual frequency-domain based computations, and the problem became mathematically tractable. Due to the recursiveness of the algorithms, the scheme was easily implemented even for small computers and was applicable for real-time on-line forecasting. An example was presented using simulated data. The results indicated the practical applicability of the proposed procedure. The procedure could be extended to include the identification/prediction of stochastic nonlinear hydrological systems, by augmenting the state vector with the ordinates of the higher order impulse responses, and then taking advantage of nonlinear filtering techniques. DATA ANALYSIS AND SYSTEM MODELLING IN URBAN CATCHMENT AREAS (IN THE NEW TOWN OF LELYSTAD, THE NETHERLANDS),
IJsselmeerpolders Development Authority, Lelystad (Netherlands). Scientific Div.
J. A. Van Den Berg.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 187-194, March 1976. 2 fig, 2 tab, 5 ref.

Descriptors: *Data processing, *Model studies, *Probability, Urban runoff, Precipitation, Sewers, Subsurface drainage, Groundwater, Equations, On-site data collections, Rainfall, Persistence.
Identifiers: *Data analysis, *Polders, *Lelystad(The Netherlands), *Zuiderzee, System modelling, Urban catchment areas, Sewer system, Probability distribution.

The new town of Lelystad, The Netherlands, had several catchment areas in its residential quarter, a parking lot, and the shopping and office center. These were located in recently reclaimed polders in the former Zuiderzee. Precipitation was the input; the discharges were the rainwater sewer system, the subsurface drainage system, and the groundwater level. Precipitation and discharges were continuously measured and automatically recorded. The objective was to determine the probability distribution of the outputs from the distribution of the input and from the deterministic operations which could be represented by a matrix. From these data, rainfall and discharge intensities were calculated for the periods of observation. Persistence, or autocorrelation, existed between these intensities when dry spells were disregarded. The first step in the data analysis was a deterministic approach, using the principle of input-response-output. The responses were environmental, producing the transformation of the input. This was demonstrated by precipitation values and inflow into storm water drains, the latter generated from outflow measurements by a deterministic relation. (Roberts - ISWS)

GEOMORPHOLOGY AND CLIMATOLOGY OF ARID WATERSHEDS,
Hebrew Univ., Jerusalem (Israel). Dept. of Geography.
A. P. Schick, and D. Sharon.
Hebrew University, Department of Geography, Final Bi-Annual Technical Report, September 1974. 162 p, 35 tab, 19 fig, 2 append.

Descriptors: *Geomorphology, *Climatology, *Watersheds(Basins), *Arid lands, *Terrain analysis, *Rainfall, Floods, Rainfall disposition, Rainfall intensity, Rainfall-runoff relationships, Bed load, Streamflow, Alluvial fans, Deposition(Sediments), Erosion, Hydrograph analysis.
Identifiers: Nahal Yael Research Watershed(Israel).

Environmental data have been collected and analyzed at the Nahal Yael Research Watershed in the Negev, Israel. The study of non-uniform fields associated with local convective processes was stressed in rainfall analysis. Records from a dense network were used to identify rain-producing cells along pre-frontal convergence lines or developing as air-mass storms. Most of the flood-producing rainfall in this region was from meso-scale connective storm cells. Such cells are usually well-separated during fall and spring months and so cover only parts of the land surface. Some 200 samples of suspended sediment collected in extremely arid watersheds were analyzed; bedload movement was found to be of major importance in the erosion and sedimentation process. Analysis of the rising limbs of flood hydrographs from Yael watersheds indicated a relationship between the duration of a rise to peak discharge, rainfall intensity, watershed infiltration and suspended sediment concentration. A sediment budget for the

Nahel Yael alluvial fan indicates net aggradation of about 1.5 cu m/year. The geologic structure of the watershed is summarized; surface flow in extreme desert terrain, streamflow and other related topics are discussed. (Jahns-Arizona)

COMPARISON STUDY OF MODELS USED TO PRESCRIBE HYDROMETEOR WATER CONTENT VALUES, PART I: PRELIMINARY RESULTS,
Air Force Cambridge Research Labs., Hanscom AFB, Mass.
R. M. Pierce, R. W. Lenhard, and B. D. Weiss.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-019 633, $3.50 in paper copy, $3.00 in microfiche. Report No. AFCRL-TR-75-0470, ERP No. 532, September 5, 1975. 20 p, 3 fig, 2 tab, 6 ref.

Descriptors: *Model studies, *Mathematical models, *Cloud physics, Analytical techniques, Atmosphere, Atmospheric physics, Clouds, Precipitation(Atmospheric), Rain, Snow, Ice, Meteorology.
Identifiers: *Liquid water content.

A preliminary study was made of several analytical techniques used to deduce profiles of integrated liquid water content (LWC). Comparison was made with aircraft and/or radar measurements for two sets of cases in order to determine if one or more of the modeling techniques would consistently yield more representative values than the others over a period of time. A brief description of the techniques used and the results of the statistical analyses applied to this study were presented. Also, a comparison of the integrated LWC for each case at the 10, 8, 6, 4 and 2 km and surface levels was presented in tabular form. Although it is possible to observe minor trends from this study, too few cases are presently available to reach any firm conclusion regarding the merits of one technique over any of the others. (Sims-ISWS)

J. F. Church, K. K. Pocs, and A. A. Spatola.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-019 630, $4.50 in paper copy, $3.00 in microfiche. Report No. AFCRL-TR-75-0370, IP No. 235, July 11, 1975. 70 p, 27 fig, 5 tab, 49 ref, 1 append.

Descriptors: *Instrumentation, *Cloud physics, *Equipment, *Sampling, Aircraft, Snow, Ice, Rain, Precipitation(Atmospheric), Drops(Fluids), Raindrops, Atmospheric physics, Atmosphere, Clouds, Data processing, Design, Analytical techniques, Meteorology.
Identifiers: *Meteorological instrumentation, Foil hydrometeor samplers.

This study presented results of research done on the continuous aluminum-foil hydrometeor sampler which is an airborne meteorological instrument that uses a continuous ribbon of aluminum-foil which moves at a constant speed past a 14.51-cu cm (2.25-cu in) sampling area aperture exposing the foil to the ambient air-flow inflight. Both liquid drops greater than 100 micrometers and solid particles greater than 50 micrometers could be identified, measured, and counted. The frozen particles, depending upon orientation, impacted on the foil leaving an almost exact replica. However, the imprint size of liquid drops could be up to 30% greater when sampled on a C-130 aircraft, depending on the true air speed of the sampling. Knowing the true aircraft speed, the foil advance speed, aperture width, and the ratio of imprint to true size, the hydrometeor size distribution and mass concentration could be determined along the aircraft's sampling path. But in certain special meteorological conditions, the accuracy of the extracted data was subject to the skills and subjective interpretation of the analyst. The continuous aluminum-foil hydrometeor samplers were subject to supercooled icing problems which on occasion have rendered the instruments inoperative. Subsequent modifications to include greater heating capability for the shutter and the area around the sampling aperture were made and were described. (Sims-ISWS)

AN ANALYSIS OF THE ERRORS ASSOCIATED WITH THE DETERMINATION OF ATMOSPHERIC TEMPERATURE FROM ATMOSPHERIC PRESSURE AND DENSITY DATA,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
R. A. Minzner.
Report No. NASA TN D-8014, January 1976. 35 p, 8 fig, 6 ref, 1 append.

Descriptors: *Remote sensing, *Air temperature, *Density, *Graphical analysis, *Atmospheric pressure, Equations, Temperature, Height, Atmosphere, Atmospheric physics, Mathematics.
Identifiers: *Error analysis, Rocket soundings.

A graph was developed for relating delta T/T, the relative uncertainty in atmospheric temperature T, to delta p/p, the relative uncertainty in the atmospheric pressure p, for situations when T is derived from the slope of the pressure-height profile. A similar graph related delta T/T to delta rho/rho, the relative uncertainty in the atmospheric density rho, for those cases when T is derived from the downward integration of the density-height profile. A comparison of these two graphs showed that for equal uncertainties in the respective basic parameters, p or rho, smaller uncertainties in the derived temperatures are associated with density-height rather than with pressure-height data. The value of delta T/T was seen to depend not only upon delta p or delta rho, and to a small extent upon the value of T or the related scale height H, but also upon the inverse of Delta h, the height increment between successive observations of p or rho. In the case of pressure-height data, delta T/T was dominated by 1/Delta h for all values of Delta h; for density-height data, delta T/T was dominated by delta rho/rho, for Delta h smaller than about 5 km. Thus, while delta T/T = delta p/p for Delta h = (square root of 2) H, which is about 10 km, delta T/T increased to 10, 100, and 1000 times delta p/p as Delta h decreased successively to 1 km, 0.1 km, and 0.01 km respectively. In the case of T derived from density-height data, this inverse relationship between delta T/T and Delta h applied only for large values of Delta h, that is, for Delta h greater than 35 km. For Delta h less than 1 km, delta T/T was congruent to delta rho/rho, independent of the size of Delta h. No limit existed in the fineness of usable height resolution of T which may be derived from densities, while a fine height resolution in pressure-height data led to temperatures with unacceptably large uncertainties. Available from the National Technical Information Service, Springfield, VA 22161 as AD-A022 484, $4.00 in paper copy, $3.00 in microfiche. Final Report 1973-75, December 31, 1975. 24 p, 8 fig, 3 tab, 16 ref, 1 append. Army DA-ERO-591-74-G0001.

Descriptors: *Precipitation(Atmospheric), *Rainfall, *Cloud physics, *Areal, Networks, Computers, Measurement, Equations, Weather patterns, Mathematical studies, On-site investigations, Meteorology.

The horizontal and vertical 'turbulence' and exchange set up and maintained by different macro-scale mechanisms (cyclones and anticyclones etc.) are well known. The role of convective air-mass clouds in this respect in the meso-scale has also been the subject of world-wide intense studies. As to the meso-scale study of apparently convective entities in the frontal and origenic cloud systems, on the other hand, much less has been done. Therefore, it was one aim of this study to shed some light on that problem. It was confirmed that even these cloud-systems generally show a markedly 'granulated' and partly convective structure of their precipitation pattern, at least down to details with a horizontal extension of about 5 km. Moreover, this study showed that even the frontal cloud systems, and their precipitation, mostly are divided into well detached cells or units of varied origin. It was concluded that their propagation offers several aspects of interest to weather forecasting and are worth further research. (Sims-ISWS)

ON THE CALCULATION OF SURFACE SHEAR STRESS USING THE PROFILE METHOD,
Geological Survey, Tacoma, Wash.
C. H. Ling.
Journal of Geophysical Research, Vol 81, No 15, p 2581-2582, May 20, 1976. 2 fig, 7 ref.

Descriptors: *Shear stress, *Surfaces, *Stress, *Ice loads, Methodology, Equations, Evaluation, Boundaries(Surfaces), Roughness(Hydraulic).

Comparison of shear stress calculations has been made between the conventional profile method and the method proposed by Ling and Untersteiner, 1974-by using the corrected drag plate measurements of the Kansas Field Program of 1968 made by the Air Force Cambridge Research Laboratories. A von Karman constant of 0.35 has been used for this comparison. The proposed method gives better stress estimates and less scatter in the roughness parameter than the conventional method. Descriptors: *Deltas, *Rivers, *Floods, *Alaska, *Arctic, Spring, Interfaces, Saline water-freshwater interfaces, Sediments, Seasonal, Suspended solids, Permafrost, Snowmelt, Runoff, Salinity, Temperature, Water temperature, On-site investigations.
Identifiers: *Colville River Delta(Alaska), Spring flooding, Ice breakup.

The seawater which accumulates beneath the sea ice at the front of the Colville River delta during winter is replaced by fresh but turbid water during flooding accompanying breakup. The wedge that initially forms is very distinct, and the floodwater within it has relatively little influence on the salinity and temperature of the seawater beneath the interface. Data showed, however, that the suspended material transported seaward in the wedge settles through the interface and the seawater beneath the interface to be deposited on the bottom. (Sims-ISWS)
W76-12997

HEAT TRANSFER CHARACTERISTICS OF A BUBBLE-INDUCED WATER JET IMPINGING ON AN ICE SURFACE,
Cold Regions Research and Engineering Lab., Hanover, N.H., Research Div.
F-C. Yen.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A010 035, $3.50 in paper copy, $3.00 in microfiche. Research Report 335, April 1975. 16 p, 15 fig, 1 tab, 13 ref.

Descriptors: *Bubbles, *Ice, *Heat transfer, Jets, Ice-water interfaces, Deicers, Ice cover, Lake ice, Laboratory tests, Equipment, Instrumentation, Mathematics, Equations.
Identifiers: *Ice prevention, Ice formation, Ice control.

An experimental study of the heat transfer characteristics of a bubble-driven water jet on an ice surface was conducted. Two Lucite columns, one 0.829 m high and 0.286 m in diameter and the other 0.219 m high and 0.140 m in diameter were used. Water levels were maintained at 0.762 and 1.524 m in the large column and 0.840 m in the small column. Hypodermic needles with openings of 0.152, 0.406 and 0.838 mm were used for bubble formation. The air flow rate was varied from 7.39 x 10 to the minus 8th power to 9.91 x 10 to the minus 5th power cu m/s. In all, 171 experimental runs were conducted. The results can be correlated by Nu = 0.1735 (Re sub i) to the 0.848 power with a correlation coefficient of 0.84, in which Nu is defined in terms of average heat transfer coefficient, sample diameter, and thermal conductivity of water. Re sub i is defined in terms of diameter of the impinging water jet at the ice surface, the centerline arrival water velocity, and the kinematic viscosity of water. (Sims-ISWS)

STRESS CONCENTRATION IN SLOPING SNOWPACK FROM GEOMETRIC IMPERFECTIONS,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
T. E. Lang, and R. L. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-022 425, $3.50 in paper copy, $3.00 in microfiche. Report No. ARO 11042.2-EN, 1975. 10 p, 8 fig, 7 ref. DA-ARO-D-31-124-73-G 175, NSF GA-3943.

Descriptors: *Snow cover, *Stress, *Creep, *Model studies, Mathematical models, Equations, Stress analysis, Snow, *Snowpacks, Shear, Shear stress, Slopes, Strain, Viscosity.
Identifiers: Viscoelastic properties.

Results were presented from developed equations on the prediction of the state of stress and creep in an idealized sloping snow slab perturbed by a basal layer shear imperfection. Stress and strain rate intensification, maximum energy loci, stress dependence on viscoelastic properties, and other related parametric evaluations were summarized. The dependence of these parameters on slope angle and size of imperfection was reported. (Sims-ISWS)
W76-13061

2D. Evaporation and Transpiration

STUDIES ON THE POTENTIAL EVAPORATION OF LAWNS UNDER DIFFERENT CONDITIONS OF UNDERGROUND WATER: A COMPARISON OF CALCULATED VALUES WITH THE VALUES OF A LYSIMETER, (IN GERMAN),
Technische Universitaet, Hanover (West Germany). Institut fuer Meteorologie und Klimatologie.
R. Kaviani.
Z Acker Pflanzebau. 139(4), p 249-258, 1974.

Descriptors: *Evaporation, Groundwater, *Lysimeter, *Analytical techniques, *Humidity, *Methodology, Soil moisture.
Identifiers: Haude method, Albrecht method, Thornthwaite method.

A comparison of lysimeter measured values of potential evaporation with the values calculated by 3 different methods (Albrecht, Haude, Thornthwaite) shows considerable differences. Whereas the Albrecht-method gives very low values and the Thornthwaite-method very high ones, the Haude-method supplies satisfactory results which come close to the measured values of potential evaporation. Under these experimental conditions, there was a close correlation between the measured potential evaporation and the actual evaporation, when the soil-humidity remained above the wilting point.--Copyright 1975, Biological Abstracts, Inc.

QUANTITATIVE RELATIONSHIP BETWEEN REFLECTANCE AND TRANSPIRATION OF PHREATOPHYTES--GILA RIVER TEST SITE,
Geological Survey, Tucson, Ariz.
R. C. Culler, J. E. Jones, and R. M. Turner.
In: 4th Annual Earth Resources Program Review, Volume III, U.S. Geological Survey Programs, Houston, Texas, January 17-21, 1972: NASA, Manned Spacecraft Center MSC-05937, p 83-1 - 83-9, 1972. 3 fig, 6 ref.

Descriptors: *Evapotranspiration, Measurement, *Remote sensing, *Aerial photography, *Vegetation effects, *Phreatophytes, Photogrammetry, Surveys, *Arizona.
Identifiers: *Gila River test site(Ariz).

The feasibility of using aerial photographs to estimate evapotranspiration (ET) from large parcels of the landscape has been studied by the U.S. Geological Survey at the Gila River Phreatophyte Project in Arizona for several years. Repetitive color-IR (infrared) aerial photography has been used since 1967 as a means of estimating the volume of transpiring vegetation covering the project site. As plants are one of the main avenues through which water vapor is lost from a hydrologic system, a measure of plant volume should provide a means for estimating the transpiration component of ET. The analysis described indicates that remote sensing can be used for this purpose. Color-IR photographs, using various film types, cameras, and filters, were obtained on 33 dates from 1967 through 1970. The photography and film processing was done by NASA and by the U.S. Geological Survey. All photographs were color transparencies. Most were taken from an elevation of 8,500 feet, and all were in 9-inch format. (Woodard-USGS)

A NOTE ON THE STEP ERROR OF SOME FINITE-DIFFERENCE SCHEMES USED TO SOLVE KINEMATIC WAVE EQUATIONS,
New Mexico Inst. of Mining and Technology, Socorro.
V. P. Singh.
Journal of Hydrology, Vol. 30, No. 3, p 247-255, July 1976. 1 fig, 17 ref.

Descriptors: *Numerical analysis, *Hydrology, *Analytical techniques, *Methodology, Compu-

ters, Mathematics, Approximation method, Equations, Stability, Mathematical studies.
Identifiers: *Kinematic wave equation, *Finite-difference schemes, Convergence, Discretization error, Step error.

The magnitude of the discretization error in numerical solutions of kinematic wave equations depends on the steplength of distance, x, and time, t, in x, t space. A round-off error is introduced each time a calculation is done. A set of finite difference equations is stable when the cumulative effect of all round-off errors is negligible. The total error is the sum of the discretization and stability errors. The discretization error is dominant in a stable and convergent scheme. An analytical treatment was developed for the discretization or step error of some finite difference schemes that are frequently used to solve the kinematic wave equations. It was shown that for convergent and stable schemes the production of step error of one scheme may not be the same as that of another. The distinction must be considered in choosing between the schemes. It was found that knowledge of step error is a useful parameter to estimate a priori the step length to be used in a given scheme. EFFECTS OF OVERBANK FLOW IN FLOOD COMPUTATIONS,
Asian Inst. of Tech., Bangkok (Thailand). Div. of Water Resources Engineering.
T. Tingsanchali, and N. L. Ackermann.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY7, Proceedings Paper 12266, p 1013-1025, July 1976. 8 fig, 10 ref, 2 append.

Descriptors: *Flood plains, *Floods, *Unsteady flow, *Overland flow, River flow, Continuity equation, Momentum equation, Hydraulics, Channel morphology, Mathematical models, Rivers, Equations, Berms.
Identifiers: *Philippines, *Bicol River(Philippines).

The derivation and application of unsteady free surface flow equations which describe floods in rivers where dynamic effects are considered in both the main channel as well as berm or overbank sections of the flood plain were presented. Literature to date considers overbank portions of a river significant only for purposes of storage. Such an assumption is not always justified. The equations were used to describe flood conditions that occurred in 1970 in the Bicol River Basin in South Luzon, Philippines. The dynamic effects of the flow in the berms were determined by comparing the computed river stages and discharges considering conditions with and without the dynamic effects of the berm flow. Identifiers: Subsurface hydrology, Limestone hydrology studies, Limestone terranes, Chalk.

Carbonate rocks, primarily limestones and dolostones, comprise roughly 15% of all sedimentary rocks that underlie 75% of the earth's surface. These rocks are of great economic importance for their own value and contain, in places, large amounts of groundwater, an important quantity of the world's supply of petroleum and natural gas, and valuable reserves of the world's metals. Because of their unique and complex characteristics, a great deal of research has been dedicated to the study of carbonate rocks. In the past decade, there has been an increased interest in carbonate rocks and, particularly, their hydrologic characteristics. Literature on carbonate rocks, describing their influence on man, appears in publications of all types, ranging from special or feature stories in newspapers and magazines to technical journals, textbooks, and treatises. The sources of the literature are worldwide, illustrating the wide distribution of carbonate rocks and their importance to man. This literature survey covered the progress of knowledge about hydrology of carbonate terranes. A 795-entry, annotated bibliography of carbonate rocks was included in this volume. (Sims-ISWS)

ONSET OF THERMOHALINE CONVECTION IN A CAVERNOUS AQUIFER,
Florida Univ., Gainesville. Dept. of Civil Engineering.
H. Rubin.
Water Resources Research, Vol. 12, No. 2, p 141-147, April 1976. 3 fig, 21 ref.

Descriptors: *Groundwater, *Geothermal studies, *Convection, *Florida, *Aquifers, Equations, Mathematical studies, Mathematical models, Heat flow, Heat transfer, Thermal water, Flow, Hydrothermal studies, Caves, Stability, Mathematics.
Identifiers: *Thermohaline convection, *Florida aquifer, *Cavernous aquifer, *Solute dispersion, *Perturbation analysis, Instability criteria, Thermal gradient.

In some groundwater aquifers, geothermal activity may lead to thermal convection. In such cases very often saline hot water is transferred from the deep layers of the aquifer into the upper layers. There is an hypothesis that such a mechanism does exist in the deep regions of the Floridan aquifer. However, the deep zone of the Floridan aquifer is extremely cavernous. Therefore even very slow motions may lead to an intensive dispersion of soluted materials and heat as well as to turbulent effects demonstrated by the invalidity of the laminar Darcy law. In this study, all these effects and their connection with the onset of thermohaline convection were investigated. It was found possible to define in the field a plane where applied perturbations are the most disturbing to the flow field. In this plane, convection motion is initiated. This plane formed an angle theta sub c with the unperturbed velocity vector. Angle theta sub c varied according to flow conditions between 0 and 90 degrees. Approaches were developed for the determination of instability criteria for different regions of the Reynolds number. (Pricket-ISWS)

ANALYSIS OF AQUIFER-AQUITARD FLOW,
Birmingham Univ. (England). Dept. of Civil Engineering.
T. D. Streltsova.
Water Resources Research, Vol. 12, No. 3, p 415-422, June 1976. 8 fig, 15 ref.

Descriptors: *Equations, *Aquifers, *Aquitards, *Groundwater movement, *Drawdown, Water wells, Water table, Leakage, Flow system, Hydraulic properties, Graphical analysis, Mathematical studies, Permeability, Storage coefficient, Specific yield, Flow.
Identifiers: *Partial penetration, *Type curves.

The general drawdown equation and its particular cases were considered for a partially penetrating well discharging at a constant rate from an aquifer which is overlain by an aquitard containing the water table. An identity was established between the exact solutions, developed in terms of the rho = mu(r)/h parameter, and those based on the finite difference approximation, developed in terms of the r/B parameter. The relations in the rho and the r/B parameter were given for a well of complete penetration. The quasi-steady drawdown equation was developed for a well of partial penetration in an aquifer-aquitard flow system. The solution was graphically presented, and its use in the distance-drawdown curve-matching procedure was described. Determination of the aquifer-aquitard formation constants was discussed. Identifiers: West-central Minnesota, *Pearl-Sallie Lakes area(Minn).

The need for study of lake-ground-water interchange has been accentuated by eutrophication of lakes in the Pearl-Sallie Lakes area of west-central Minnesota. The local ground-water flow system is dominated by a sand and gravel outwash aquifer that is sandwiched between two layers of till in the western part of the area and exposed at the land surface in the eastern part. Water discharges from the aquifer into lakes in the outwash area but the aquifer is recharged from lakes in the till-covered area. Irregular aquifer geometry has resulted in a complex ground-water flow system. Simulation of the system by areal and vertical-section models has shown that the lakes significantly control ground-water flow near their shores. Evaluation of the models has indicated that they may be used to guide field-data collection, interpretation of data, and quantification of the ground-water flow system. With modification, the models could be used to predict aquifer response to transient stresses. Also, they could be incorporated into more complex models, to determine the movement of solutes in the ground-water system. (Woodard-USGS)

Descriptors: *Computer models, *Groundwater movement, *Saturated flow, *Numerical analysis, Methodology, Forecasting, Groundwater, Water table, Confined water, Aquifers, Computer programs.
Identifiers: *FORTRAN IV, Two-dimensional simulation, Finite-difference methods, Strongly implicit procedure.

The model will simulate ground-water flow in an artesian aquifer, a water-table aquifer, or a combined artesian and water-table aquifer. The aquifer may be heterogeneous and anisotropic and have irregular boundaries. The source term in the flow equation may include well discharge, constant recharge, leakage from confining beds in which the effects of storage are considered, and evapotranspiration as a linear function of depth to water. The theoretical development includes presentation of the appropriate flow equations and derivation of the finite-difference approximations (written for a variable grid). The documentation emphasizes the numerical techniques that can be used for solving the simultaneous equations and describes the results of numerical experiments using these techniques. The documentation includes a flow chart, program listing, an example simulation, and sections on designing an aquifer model and requirements for data input. It illustrates how model results can be presented on the line printer and pen plotters with a program that utilizes the graphical display software available from the Geological Survey Computer Center Division. In addition the model includes options for reading input data from a disk and writing intermediate results on a disk. (Woodard-USGS)

STUDIES ON THE INTERACTIONS BETWEEN SOIL WATER AND THINLY DISPERSED SOLID MATTER USING THE MOIST HEAT METHOD, (IN ROMANIAN),
Institutul de Studii si Cercetari Pedologie, Bucharest (Rumania).
S. Balan.
An Inst Stud Cercet Pedol. 40, p 13-29, 1972.

Descriptors: *Soil water, *Soils, Soil profiles, Dispersion, Soil texture, Cation exchange, Heat, *Soil moisture.
Identifiers: *Moist heat method.

About 300 determinations were made with the moist heat method in different types of soils including a wide range of variations from acid brown sandy soils up to intensely clayey vertic wet meadow soils. Determinations were made in all horizons and subhorizons, at the same levels at which the other determinations and physical, chemical and mineralogical analysis were performed. The values of moist heat were influenced by different factors, the more important ones being texture, humus, mineral composition, cation exchange capacity and soil structure. The moist heat determined on the whole soil profile was used to estimate the effective soil particle surface area. The results are in agreement with literature data obtained for similar soils.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: *Ecotype differentiation, Sagittaria-Graminea-Var-Weatherbiana, *Sagittaria, Sagittaria-Cristata, Sagittaria-Graminea, Sagittaria-Graminea-Var-Chapmani, Sagittaria-Graminea-Var-Graminea, Sagittaria-Platyphylla.

Soil from populations of 4 ecotypes of 2 varieties within the S. graminea complex (S. graminea var. weatherbiana, S. graminea var chapmani), a 3rd

variety of this complex (S. graminea var. graminea), and from populations of S. cristata and S. platyphylla were analyzed. Values for pH, CaO, MgO, P2O5 and K2O were established, and tests for significance of the data made. Significant soil nutrient levels were established that were characteristic for and served to delimit each taxon. Two of the 4 ecotypes were found to be specific to certain soils. Edaphic adaptation appears to be of importance in this group of plants and may be of significance in other hydrophytes.--Copyright 1974, Biological Abstracts, Inc.

MEASUREMENT AND EVALUATION METHODS FOR THE DETERMINATION OF THE UNSATURATED HYDRAULIC CONDUCTIVITY OF SOILS IN SITU, (IN GERMAN).
U. Krahmer.
Z Pflanzenernaehr Bodenkd. 137(2), p 95-107, 1974.

Descriptors: Hydraulic conductivity, Measurement, Methodology, Soils, Evaporation, Soil profiles, Soil moisture, Tension, Tensiometers.

The unsaturated hydraulic conductivity was determined as a function of the moisture tension in 32 soil profiles in situ. Values were typical of Nordrhein-Westfalen(Germany) and included ground- and static-water profiles. The surface of the almost saturated soil was subjected to evaporation and changes in moisture and potential in the soil were measured. Measurements were made with Neutron moisture gauges and tensiometers. A given moisture tension increase in any soil compartment was attributed to a change in water content. The combined gauge and tensiometer measurements were analyzed using the Darcy and continuity equations for the quasistable state with the help of electronic data processing equipment.--Copyright 1975, Biological Abstracts, Inc.

INVESTIGATIONS CONCERNING MAPPING AND CLASSIFYING OF MARSH SOILS, (IN GERMAN),
Kiel Univ. (West Germany). Geologisch-Palaeontologisches Institut und Museum.
W. Prange, G. Bruemmer, and E. Weber.
Meyniana. 25, p 59-86, 1974.

Descriptors: *Soil classification, *Mapping, Europe, Ion exchange, Clays, Soil compaction, Marsh management, Soil compaction.
Identifiers: West Germany, *Marsh soils, *Calcium magnesium ration.

Results from a large scale soil mapping on the North Frisian (West Germany) mainland indicate that field characteristics, particularly the grain-size, bedding and degree of compaction, are closely correlated with each other and with other filed and laboratory data. Exchangeable ions and the Ca/Mg-ratio, however, indicate no connections with the soil units and with most of the other field characteristics but are determined by processes of the development of soil and landscape, such as desalting and decalcification, silicate weathering, fresh-and salt-water inundations, salty precipitations, salty groundwater and fertilization. Therefore the Ca/Mg-ratio is not suitable for differentiating between more clayey compacted Knick-marsh soils and less clayey permeable Kleimarsh soils.--Copyright 1975, Biological Abstracts, Inc.

FINITE DIFFERENCE AND FINITE ELEMENT SIMULATION OF FIELD WATER UPTAKE BY PLANTS,
Institute for Land and Water Management Research, Wageningen (Netherlands).
R. A. Feddes, P. Kowalik, S. P. Neuman, and E. Bresler.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 81-98, March 1976. 15 fig, 10 ref.

Descriptors: *Finite element analysis, Flow, *Soil management, *Soil investigations, *Plant growth, Hydraulic conductivity, Root zone, Soil water, Numerical analysis, Water balance, Evapotranspiration, Unsteady flow, *Soil-water-plant relationships, Moisture content.
Identifiers: *Finite element simulation, Soil-plant system, Root-soil interface.

The problem of non-steady flow of water in a soil-plant system was described by adding a sink term to the continuity equation for soil water flow. The sink term was defined in two different ways. First, it was considered to be dependent on the hydraulic conductivity of the soil, on the difference in pressure head between the soil and the root-soil interface, and some root effectiveness function. Second, the sink was taken to be a prescribed function of the soil water content. The partial differential equation applying to the first problem was solved by both the finite difference and a finite element technique. The equation applying to the second problem was solved by a finite difference approach. The paper verified the numerical models against field measurements. It compared the results obtained by the three numerical methods and showed how the finite method could be applied to complex but realistic two-dimensional flow situations. Two examples were given. The first example concerned one-dimensional flow. It compared numerical results with those obtained experimentally in the field from water balance studies on red cabbage grown on a clay soil in the presence of the water table. The second example described two-dimensional flow in a complex field situation in the Netherlands where flow took place under cropped field conditions through five anisotropic layers. Water was supplied to the system by infiltration from two unlined ditches and was withdrawn from the system by evapotranspiration and by leakage to an underlying pumped aquifer. (Roberts-ISWS)
W76-12830

A NEW MODEL FOR PREDICTING THE HYDRAULIC CONDUCTIVITY OF UNSATURATED POROUS MEDIA,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
Y. Mualem.
Water Resources Research, Vol. 12, No. 3, p 513-522, June 1976. 4 fig, 3 tab, 34 ref, 3 append. U.S.-ISBF 422.

Descriptors: *Unsaturated flow, *Hydraulic conductivity, *Mathematical models, *Porous media, Moisture content, Pore pressure, Saturation, Theoretical analysis, Soil properties, Homogeneity, Porosity, Capillary conductivity, Soil types, Model studies, Equations, Mathematical studies.
Identifiers: *Tortuosity.

A simple analytic model was proposed which predicts the unsaturated hydraulic conductivity curves by using the moisture content-capillary head curve and the measured value of the hydraulic conductivity at saturation. It was similar to the Childs and Collis-George (1950) model but used a modified assumption concerning the hydraulic conductivity of the pore sequence in order to take into account the effect of the larger pore section. A computational method was derived for th determination of the residual water content ar for the extrapolation of the water content-capilla head curve as measured in a limited range. Th proposed model was compared with the existin practical models of Averjanov (1950) Wyllie ar Gardner (1958), and Millington and Quirk (196 on the basis of the measured data of 45 soils. seemed that the new model is in better agreeme with observations. (Visocky-ISWS)

INVESTIGATIONS ON THE WATER REGIM OF THE MAIN SOIL TYPES OF THE CR RIVER PLAIN, (IN ROMANIAN),
Institutul de Studii si Cercetari Pedolog Bucharest (Rumania).
I. Vlas, and E. Stepanescu.
An Inst Stud Cercet Pedol. 40, p p 89-9 1972(1974).

Descriptors: *Flood plains, *Soil typ *Chernozems, Wheat, Corn(Field), Physical p perties, Chemical properties, Hydraulic prop ties.
Identifiers: *Cris River plain(Romania).

Studies were carried out for 4 yr on the main s types (medium leached chernozem free of phrea supply, medium leached chernozem-like mead soil, wet meadow soil, brown flood plain and al vial soils) under wheat and corn. The physic chemical and hydric properties (wilting coe cient, field moisture capacity and available wa capacity) are described, and the water regime determined in terms of soil types and pla requirements. In these soils the type of wa regime is differentiated in terms of their main p perties. In medium leached chernozems with water supply, the water regime is periodica deep-penetrating; in medium leached chernozem wet meadow and alluvial soils, it is at tim deeply phreatic and capillary.--Copyright 19 Biological Abstracts, Inc.

R. Vallderuten, J. T. Ligon, and J. R. Lambert.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-18, 1975. Chicago, Illinois, 29 p, 14 fig, 14 ref. ASAE Paper 75-2576.

Descriptors: *Soil moisture, *Irrigation, *Subsurface irrigation, *Model studies, Simulation analysis, Soil-water-plant relationships, Climatic data.

A simulation model was developed to predict the soil moisture regime with subirrigation. Conclusions drawn from the performance of the model are: (1) the simulation model incorporating some plant physical characteristics, soil and water properties, and climatic variables, gave reasonable results; (2) the physical process of water movement from the water table through the root system under subirrigation conditions is highly related to the evaporative losses at the surface; (3) water uptake by the root system is influenced by the root distribution and by the hydraulic characteristics of the soil; (4) a relatively small portion of the roots located in the vicinity of the water table is responsible for a large part of the water uptake; and (5) further studies involving a fluctuating water table in heterogenous soils are needed to obtain a simulation model more representative of the actual case. PLANT WATER STRESS CRITERIA FOR IRRIGATION SCHEDULING,
North Dakota State Univ., Fargo. Dept. of Agricultural Engineering.
E. C. Stegman, L. H. Schiele, and A. Bauer.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-18, 1975, Chicago, Illinois. 22 p, 7 fig, 6 tab, 18 ref. ASAE Paper 75-2555.

Descriptors: *Soil water, *Soil moisture, *Soil-water-plant relationships, *Scheduling, Crop response, Plant physiology, Plant tissues, Irrigation, Irrigation effects.

This study was conducted to determine the potential for relating plant water stress development to variables indicative of prevailing soil and atmospheric environments. Given such relationships irrigation scheduling services should be better able to use plant stress oriented criteria for determining when to irrigate. Stress development was evaluated by leaf xylem pressure and stomatal diffusion resistance measurements. Data sets were obtained for 4 to 5 crops at two Irrigation Branch Stations in North Dakota. The two sites provided soil types with differing hydraulic properties and available water holding capacities. Leaf xylem pressure data for each crop-soil combination were correlated by regression procedures with ambient air temperatures and root zone soil moisture content. Subsequent application of these xylem pressure levels as critical limits to each regression model permitted estimation of allowable root zone soil

moisture depletion relative to expected ambient air temperatures. This procedure offers a method for interpreting water balance estimates of soil moisture deficit and advance forecasts of daily maximum air temperatures for need of irrigation. (Skogerboe-Colorado State)

Report No. TN D-8199, May 1976. 55 p, 7 fig, 6 tab, 11 ref, 2 append.

Descriptors: *Remote sensing, *Soil moisture, *Microwaves, *Aircraft, *Arizona, Instrumentation, Measurement, Surveys, Equations, Radiation, Infrared radiation, Temperature, Soil temperature, Irrigation, On-site investigations.
Identifiers: Radiometers.

The results presented were derived from measurements made during the April 5 and 6, 1974 flights of the NASA P-3A aircraft over the Phoenix, Arizona agricultural test site. The purpose of the mission was to study the use of microwave techniques for the remote sensing of soil moisture. These results included infrared (10- to 12-micrometers) 2.8-cm and 21-cm brightness temperatures for approximately 90 bare fields. These brightness temperatures were compared with surface measurements of the soil moisture made at the time of the overflights. These data indicated that the combination of the sum and difference of the vertically and the horizontally polarized brightness temperatures yield information on both the soil moisture and surface roughness conditions. FEEDING CHARACTERISTICS AND PREDATION IMPACT OF CHAOBORUS (DIPTERA, CHAOBORIDAE) LARVAE IN A SMALL LAKE.
Toronto Univ. (Ontario). Inst. for Environmental Studies and Engineering.
A. Y. Fedorenko.
Limnology and Oceanography, Vol. 20, No. 2, March 1975. p 250-258, 11 ref, 7 fig.

Descriptors: *Ecology, *Predation, *Feeding rate, Temperature, Larvae, Size, Diel migration, *Diptera, Lakes, Behavior, Food habits.
Identifiers: *Chaoborus.

Data showed that, in general, feeding rates of C. americanus and C. trivittatus larvae increased with temperature, prey density and larval size and varied with prey type. Old fourth instar C. trivittatus larvae showed no change in feeding rates with temperature change. It was concluded that, since these larvae undergo extensive diel vertical migrations into the cold, food-poor hypolimnion, the maintenance of a relatively high feeding rate despite cold temperatures would be advantageous. Remaining larvae migrate less extensively and their feeding rates decline sharply as temperature falls. An absence of any pattern in day-to-day food intake by larvae held in the laboratory was noted. Estimated mean percentage of standing crop of prey eaten by Chaoborus was: 2% for copepod nauplii, 3% for Diaptomus tyrelli, 9% for Diaptomus kenai, and 4% for Diaphanosoma. Seasonal and spatial segration and size incompatability of predator and prey influenced Chaoborus predation. (Chilton-ORNL)

WAVE-INDUCED MASS TRANSPORT IN WATER WAVES,
Delaware Univ., Newark. Dept. of Civil Engineering; and Delaware Univ., Newark. Coll. Marine Studies.
R. A. Dalrymple.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW2, Proceedings Paper 12158, p 255-264, May 1976. 7 fig, 2 tab, 13 ref, 2 append.

Descriptors: *Hydrodynamics, *Flow profiles, *Waves(Water), Coastal engineering, Currents(Water), Velocity, Theoretical analysis, Equations, Mathematical studies, Viscosity, Shear.
Identifiers: *Mass transport, *Wave-current interaction, Wave energy, Velocity distribution, Eulerian mass transport distribution.

The Eulerian mass transport under water waves was studied for an inviscid fluid using finite amplitude wave theories. The distribution of the transport over the water depth for example waves was shown to be confined to a region above the wave trough and to be of lesser magnitude than predicted by Airy wave theory. A measured mean velocity was defined to examine the effect of time-averaging over the duration of immersion, and its variation over the water column was shown. Finally, the presence of a linear shear current in the direction of the wave was shown to alter the total mass transport principally by superposition. (Adams-ISWS)

Identifiers: *Infusoria, Kremenchug Reservoir, Strombidium-gyrans, Strombidium-viride, Tintinnidium-fluviatile, Ukrainian-SSR, USSR.

Seasonal dynamics of infusoria (dominant species: Tintinnidium fluviatile, Strombidium viride, S. gyrans) numbers and biomass and their horizontal distribution and variation in the species composition were studied during the vegetation period of 1972. The Infusoria production for the vegetation period was 39.43 g/m3 (236.6g/2); the average monthly P/B (production/biomass) coefficient, 23. Destruction of organic matter resulting from respiration was equal on the average to 38.6 mg of dry organic matter/1 m3 of water for 24 h, or 7.98 g/m3 of dry (39.9 g/m3 of green) organic matter for the vegetation period (Ukrainian SSR, USSR).--

2I. Water In Plants

COMPARATIVE STUDIES OF PLANT GROWTH AND DISTRIBUTION IN RELATION TO WATERLOGGING: VII. THE INFLUENCE OF WATER-TABLE FLUCTUATIONS ON IRON AND MANGANESE AVAILABILITY IN DUNE SLACK SOILS,
Trent Univ., Peterborough (Ontario). Dept. of Biology.
R. Jones.
J Ecol. 61(1), p 107-116, 1973.

Descriptors: *Plant growth, *Distribution, *Iron, *Manganese, Seasonal, Soils, Dunes, Water level fluctuation, *Organic matter, Soil profiles.
Identifiers: Agrostis-Sp, Carix-Sp, Equisetum-Sp, *Waterlogging, Watertable.

The possibility that a seasonal trend, associated with flooding, of available Fe and Mn occurred in dune slack soils was investigated. It was found that availability increased when soils were flooded in winter and spring, was highest in early summer, and that it declined with the falling water-tables in late summer. High organic matter content of dune slack soils was associated with high concentrations of available Fe and Mn. The exchangeable iron and manganese content of the soil profile decreased with depth at each of the 3 sites studied (Carex, Agrostis and Equisetum dominants, respectively (Great Britain), corresponding with the decreasing organic matter content down the profile. Total Fe and Mn were greatest in the surface layers, probably as a result of precipitation and the higher organic matter content. The possible effect of Fe and Mn availability on the distribution of dune slack plants is discussed. (See also W72-14874, W73-09063, and W73-09064).--Copyright 1974, Biological Abstracts, Inc.

ENVIRONMENTAL AND CULTURAL PRECONDITIONING EFFECTS ON THE WATER USE RATE OF AGROSTIS PALUSTRIS HUDS., CULTIVAR PENNCROSS,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
R. C. Shearman, and J. B. Beard.
Crop Sci. 13(4), p 424-427, 1973.

Descriptors: *Light intensity, *Water temperature, Irrigation, *Nitrogen, Nutrients, *Stomata, Absorption.
Identifiers: *Agrostis-Palustris, Cultivars, Penncross.

Preconditioning effects of light intensity, growing temperature, irrigation frequency, cutting height, mowing frequency, and N nutrition level on water use rate and stomatal density of 'Penncross' creeping bentgrass (A. Palustris) were investigated. Water use rates were recorded as percent moisture lost during exposure to 33C 40% relative humidity, 4300-lux light intensity, and a constant airflow of 186 cm/sec in a special wind tunnel apparatus. Stomatal density counts were made at 430X from the nitrocellulose replications of the leaf surface. The preconditioning effects of cutting height, light intensity, and N nutrition level had the greatest influence on water use rate. Irrigation and mowing frequency were intermediate in their influence. Growing temperature had the least effect among the factors considered. Stomatal density was influenced most by light intensity, and growing temperature had the next greatest effect. Irrigation frequency had an intermediate effect. N nutrition level had the least influence of the factors studied. Water use rate was positively correlated (r = 0.88) to stomatal density in the light intensity study. However, it was negatively correlated (r = -0.98) to stomatal density for the N nutrition level study. No significant correlations were observed for growing temperature or irrigation frequency.--Copyright 1974, Biological Abstracts, Inc.

STUDIES ON HELMINTHS OF NORTH DAKOTA: V. LIFE HISTORY OF PHYLLODISTOMUM NOCOMIS FISCHTHAL, 1942 (TREMATODA:GORGODERIDAE),
Nebraska Univ., Lincoln. Dept. of Zoology.
W. W. Wanson, and O. R. Larson.
J Parasitol. 58(6), p 1106-1109, 1972.

Descriptors: *North Dakota, History, *Trematodes, Clams, *Worms, *Parasites.
Identifiers: *Gorgoderidae, *Helminths, Hybopsis-Biguttata, Notropis-Cornutus, Phyllodistomum-Nocomis, Rhinichthys-Cataractae, Semotilus-Atromaculatus, Sphaerium-Striatinum, *Forest River(ND), Hornyhead chubs.

Sporocysts and cercariae from Forest River, North Dakota, develop inside the gills of the fingernail clam, Sphaerium striatinum, and cercariae encyst within their daughter spoocysts. Metacercariae fed to 4 spp. of minnows (Hybopsis biguttata, Semotilus atromaculatus, Notropis cornutus, Rhinichthys Cataractae) were recovered as immature worms from kidney ducts and urinary bladders of all 4 spp. Only in hornyhead chubs (H. biguttata) did worms mature into egg-bearing adults. The definitive host acquires the parasite by eating infected clams.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *Petroleum yeasts, Liver lipids, F cages, Cholesterol.

The growth rate of rainbow trout fingerlings rai in small aquaria in previous research was lo Another feeding test was conducted in 0.2-m cages set in a raceway for 42 days and a succe ing 26 days. Test diets were fed to fish on schedule. After the test periods liver and carc lipids were extracted and analyzed for choleste content and fatty acid composition. Average da growth rates with fish meal were 3.1% (form period) and 2.5-2.7% (latter period). Petrole yeast lots showed a lower growth rate and feed ficiency than fish meal lots in the former perio but results as good as those of the meal lots in t latter period. Although addition of 3% grease s tened the pellets feeding results of the grease-su plemented petroleum yeast pellets were inferior those of the non-supplemented pellets. Yeast fr the drainage of soybean cookers contained 45.7 crude protein. Combined feeding of the ye resulted in good fish growth but the lowest feed ficiency among the test diets. The fatty acid p tern of petroleum yeast which contained apprec ble odd-number fatty acids was reflected m distinctly in carcass lipids than in liver lipids. Li lipids from fish fed with diets containing 65% f meal or 3% grease had markedly higher conte of cholesterol than those from fish fed SCP di or non-grease diets.--Copyright 1976, Biologi Abstracts, Inc.

LEAF WATER POTENTIAL AND MOISTU BALANCE--FIELD DATA,
Agricultural Research Service, Auburn, Ala.; a Alabama Agricultural Experiment Station, A burn.
M. G. Huck, V. D. Browning, and R. E. Young.
Presented at the 1975 Winter Meeting of the Am ican Society of Agricultural Engineers, Decemb 15-19, 1975, Chicago, Illinois. 15 p, 6 fig, 2 tab, ref. ASAE Paper 75-2582.

Descriptors: *Root development, *Root distrib tion, *Root system, Soil moisture, Soil water, So water-plant relationships, Irrigation, Irrigati practices, Transpiration.
Identifiers: *Leaf water potential.

The experimental hypothesis that increased ro growth in a larger soil reservoir will make ad tional water available to the plant was tested a largely proved to be true. However, the corrollar based on a suggestion that increased water pote tial will permit a more rapid growth of cott plants, has been cast into serious doubt. If t osmotic component of leaf water potential neglected, the accumulated data from 3 years field experiments strongly suggest that plan growing under these conditions have a slight lower leaf water potential when the availability additional soil water permits growth of a larg plant with a higher transpirational deman (Skogerboe - Colorado State)

ntifiers: *Blue grama, US/IBP Pawnee Site orado).

d experiments with blue grama (Bouteloua ilis) were conducted during the 1973 growing season at the US/IBP Pawnee Site in northern Colorado using root observation windows to record root differentiation and growth. Roots began to grow and differentiate shortly before leaf growth was evident. Soil desiccation in mid-growing season caused death and decomposition of 30 to 60% of the newly formed roots. Roots are transient, and their functional development parallels the degree of suberization, with young nonsuberized roots concentrated in soil profile regions where the soil water potential was high to handle water uptake. There was massive root growth near the end of the growing season when soil water potential was high. Root growth late in the season was greatest near the plant's crown, which caused increased root biomass in upper levels of the soil profile as the season progressed. An empirical equation for root growth and development is presented. (Jahns-Arizona)

COMPARATIVE ESTIMATION OF THE ROLE OF DETRITUS AND ALGAE IN NEOMYSIS MIRABILIS (CZERNIAVSKY) NUTRITION, (IN RUSSIAN),
Institute of Biology of the Southern Seas, Sevastopol (USSR).
G. A. Pechen'-Finenko, and T. V. Pavlovskaya.
Gidrobiol Zh. 11(2), p 39-44, 1975.

Descriptors: Analytical techniques, *Algae, Diurnal, *Detritus, Waste assimilative capacity, Aquatic animals, Carbon radioisotopes, Estimating, Aquatic plants.
Identifiers: Gymnodinium-kowalerskii, *Gymnodinium-spp., *Neomysis-mirabilis, Peridineae, *Radiocarbon method.

The efficiency of the nutrition of N. mirabilis on vegetative and animal detritus, melanin and living Peridineae algae was determined by the radiocarbon method. The diurnal value of the 'index of filling' of 4 suggested foods was highest for the living algae Gymnodinium kowalevskii; animal detritus was consumed more effectively than vegetative detritus. The diurnal ration value of the animals with an excess Gymnodimium concentration was 15.7 and 30 times as high as detritus and melanin diurnal rations. Balance experiments concerning the dependence of algae consumption and assimilation on concentration, showed that only the highest of the suggested concentrations (1.6 mg/l of green weight) can meet the food requirements of N. mirabilis.--Copyright 1976, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

BLUFF EROSION, RECESSION RATES, AND VOLUMETRIC LOSSES ON THE LAKE MICHIGAN SHORE IN ILLINOIS,
Illinois State Geological Survey, Urbana.
R. C. Berg, and C. Collinson.
Environmental Geology Notes, Report EGN 76, No. 76, July 1976, 33 p, 19 fig, 10 tab, 14 ref.

Descriptors: *Erosion, *Erosion rates, Bank erosion, *Lake Michigan, *Lake shores, Shore protection, Littoral drift, Sediments, Shoreline cover, Geology, Groundwater, *Illinois.

Significant bluff erosion is apparent at more than 21 sites on the Illinois shore of Lake Michigan between Winnetka and Waukegan. The Lake Bluff shore was studied in some detail to determine what characteristics contribute to its instability and recession. It was concluded that the recession can be attributed to high lake levels bluff denudation, inadequate shore protection, weakness of earth materials in the bluffs, oversteep slopes, excessive water pressure affecting groundwater quantity and gradient, surface drainage and seepage, and lack of littoral drift sediments and the resultant absence of protective beaches. EROSION AND TRANSPORT OF BED-LOAD SEDIMENT,
Koninklijke Shell Exploratie en Produktie Laboratorium, Rijswijk (Netherlands).
R. F. Luque, and R. van Beek.
Journal of Hydraulic Research, Vol. 14, No. 2, p 127-144, 1976. 10 fig, 15 ref.

Descriptors: *Bed load, *Erosion, *Sediment transport, Deposition(Sediments), Saltation, Sands, Gravels, Hydraulics, Equations, Mathematical studies, Laboratory tests, Scour.
Identifiers: *Mean critical shear stress, *Nonceasing scour, Average particle velocity, Shield grain-movement condition, Magnetite grain, Walnut grain.

Results of a series of experiments were presented in which were measured: the mean critical bed shear stress at SHIELDS' grain-movement condition and at the initiation of non-ceasing scour, the rate of bedload transport, the average particle velocity, the rate of deposition, and the average length of individual steps of saltating bed-load particles, in water, as a function of the time-mean bed shear stress. These experiments were performed in a closed rectangular flow channel at different slopes of the bed surface and using five different bed materials (two sands, gravel, magnetite and walnut grains). A comparison of the threshold drag acting at different downward slopes of the bed surface (0, 12, 18 and 22 degrees) resulted in a surprisingly large critical-drag angle of 47 degrees. The initiation of non-ceasing scour of a loose granular bed was studied experimentally behind a consolidated bed of the same material as the loose bed. The corresponding instantaneous threshold drag was about three times larger than the threshold drag acting at SHIELDS' grain movement condition. The rate of bed-load transport

measured as a function of the mean bed-shear stress satisfied a generalized MEYER-PETER and MULLER formula (1948), also at various downward slopes of the bed surface, as investigated up to 22 degrees. The rate of particle deposition was found to be proportional to the rate of bed-load transport, and the average length of individual particle steps was found to be a constant. This implied that the probability of a bed-load particle being deposited when striking the bed surface is independent of the flow rate within the experimental range. This result contradicted EINSTEIN'S theory of bed-load transport (1950). (Lee-ISWS)

NEW DIVER-OPERATED BEDLOAD SAMPLER,
Georgia Inst. of Tech., Atlanta. Dept. of Geophysical Science.
D. G. Waslenchuk.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY6, Proceedings Paper 12179, p 747-757, June 1976. 1 fig, 4 tab, 8 ref, 2 append.

Descriptors: *Bed load, *Channels, *Bed load samplers, *Sampling, *Sediment discharge, Streams, Scuba diving, Sands, Equation, Instrumentation, On-site investigations.
Identifiers: *Diver-operated samplers.

The paper described a scuba-diver operated sampler for the measurement of bedload discharge in any stream. This was a portable pit type sampler which was pushed into the riverbed by a diver. Sediment particles were deposited in the sampler as they were transported over the leading edge of the wedge-shaped cavity. The sampler opening was adjustable in size. In the testing, the sampler performed well compared to the dune-tracking method of bedload sampling. (Bhowmik-ISWS)

EMISSION OF SULFUR FROM LAKE ONTARIO SEDIMENTS,
Canada Centre for Inland Waters, Burlington (Ontario).
J. O. Nriagu, and R. D. Coker.
Limnology and Oceanography, Vol. 21, No. 4, p 485-489, July 1976. 1 fig, 1 tab, 21 ref.

Descriptors: Sulfur, *Sulfur compounds, *Lake Ontario, *Lake sediments, *Sediments, *Great Lakes, Hydrogen sulfide, Analytical techniques, Inorganic compounds, Water quality, Surface waters, Lakes, Bottom sediments, Analysis, Chemistry, Mass spectrometry, Instrumentation, Equations, Mathematical studies.
Identifiers: *Sulfur emissions(Sediments), *Lake Ontario sediments, *Lake Ontario basin, *Volatile sulfur compounds, *Sulfur cycle, Lacustrine sediments, Benthos corer, Analytical methods, Analytical procedures, Isotope-ratio mass spectrometer, Sulfur 32, Sulfur 34, Elemental sulfur, Sulfur release.

Calculations indicated that about 600,000 kg of sulfur is released annually from Lake Ontario sediments. It was concluded that this constitutes about 1 percent of the annual sulfur input into the sediments and is insignificant compared to the total sulfur that cycles annually through the lake. Also, the sulfur released from the sediments is enriched in S32 with the result that the sulfur in the historical layers is characterized by high delta S34 values. (Henley-ISWS)

Identifiers: Atmospheric input, Mineral c stituent, Forest ecosystems, Atmospheric c tributions, Southern Appalachians, Cowe Basin, Walker Branch, Dry fallout, Nutrient inp

The atmospheric contributions of elements precipitation and dry fallout to forest ecosyste were measured at two sites in the southern palachians. At both sites, relative mean ann concentrations of cations in bulk precipitat were in the order Ca is greater than Na is grea than K is greater than Mg. At the Cowe Hydrologic Laboratory in North Carolina, aver annual inputs of Ca(++), Na(+), K(+), Mg(+ and NH4-N in 1970-1973 were 4.88, 3.52, 1. 1.01, and 0.52 kg/ha/yr, respectively. At Wal Branch, Tennessee, the inputs of these eleme during the same time period were 15.73, 3.89, 2. 2.94, and 2.37 kg/ha/yr. The inputs of NO3 PO4-P, and Cl(-) in 1972-1973 were 2.88, 0.19, 8.53 kg/ha/yr at Coweeta. Inputs of NO3-N PO4-P were 4.61 and 0.55 kg/ha at Walker Bra over the same period. One reason for differen in bulk precipitation chemistry was greater dry lout for some cations at Walker Branch than Coweeta. For both sites, dry fallout associa with local land use activities influenced seaso concentrations of bulk precipitation except Na(+), which appeared to be partly derived fr marine sources. Total inputs of elements w considered to be minimum estimates for b forest ecosystems due to sampling and analyti methods. (Henley-ISWS)

SOME CURRENT DIRECTED MOVEMENTS OF MACROBRACHIUM ACANTHURUS (WIEGMANN 1836) (DECAPODA, PALAEMONIDAE) UNDER LABORATORY CONDITIONS,
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
D. A. Hughes, and J. D. Richard.
Ecology. 54(4), p 927-929, 1973.

Descriptors: *Larvae, *Shrimp, Brackish water, Estuaries, Migration, *Salinity.
Identifiers: Decapoda, *Macrobrachium-acanthurus, Palaemonidae.

The larvae of some species of freshwater shrimp of the genus Macrobrachium will develop only in brackish water. The increased incidence of these shrimp within estuaries and in the lower reaches of rivers at certain times of the year suggests that regular downstream migrations are carried out to facilitate the transport of larvae to a brackish estuarine environment. Current chamber experiments conducted in the laboratory indicated that gravid individuals tend to swim consistently downstream whereas other adult females tend to swim consistently upstream. Other current chamber experiments showed that larval stages, held in brackish water, will drop to a position low in the water column when salinity is reduced (simulating an ebb tide) and revert to swimming higher in the water column when the salinity is increased (simulating a flood tide). These responses are interpreted as a mechanism whereby larvae are prevented from being carried out to sea, thus facilitating their eventual migration upstream to a freshwater environment.--Copyright Biological Abstracts, Inc., 1974.

DISTRIBUTION OF PELAGIC FISHES IN THE SHEEPSCOT RIVER-BACK RIVER ESTUARY, WISCASSET, MAINE,
Maine Univ., Orono. Dept. of Zoology.
C. W. Recksiek, and J. D. Mc Cleave.
Trans Am Fish Soc. 102(3), p 541-551, 1973.

Descriptors: *Distribution, Fish, *Maine, *Estuaries.
Identifiers: Alosa-aestivalis, Alosa-mediocris, Alosa-pseudoharengus, Alosa-sapidissima, Brevoortia-tyrannus, Clupea-harengus, Merluccius-bilinearis, Morone-Americana, Morone-saxatilis, Osmerus-mordax, Peprilis-triacias, Pollachius-virens, Pomatomus-saltarix, Scomber-scombrus, Squalus-acanthias, Wiscasset(Maine), Back River, Sheepscot River, *Pelagic fishes.

Species (15) of pelagic fishes (Alosa sapidissima, A. mediocris, A. pseudoharengus, A. aestivalis, Clupea harengus, Osmerus mordax, Brevoortia tyrannus, Scomber scombrus, Squalus acanthias, Morone saxatilis, Merluccius bilinearis, Peprilis triacanthus, Pomatomus saltatrix Pollachius virens, Morone Americana) were collected in 156 gill net sets at 8 locations in the Sheepscot River-Back River estuary, Wiscasset, Maine, June 1970 through Dec. 1971. Highest catches occurred June through Aug. Only the rainbow smelt is a year-round resident. Differences in abundance in space and time are apparently related to temperature. During the summer, alewives, blueback herring, and Atlantic menhaden were most abundant in the relatively warm Back River estuary, while Atlantic herring, Atlantic mackererel and spiny dogfish were most abundant in the more oceanic Sheepscot River estuary. Prolonged near-freezing temperature apparently limit the time pelagic fishes spend in the estuary and limit the number of species which can inhabit it. It is hypothesized that the distribution of pelagic species which exhibited preferences for colder water, such as Atlantic herring, would be most affected by artificial warming of the surface waters of the Back River estuary if a new atomic powered generating plant were allowed to discharge heated effluent directly into it.--Copyright 1974, Biological Abstracts, Inc.

FISH INVESTIGATIONS IN LONG ISLAND SOUND AT A NUCLEAR POWER STATION SITE AT SHOREHAM, NEW YORK,
New York State Dept. of Environmental Conservation, Albany.
C. S. Zawacki, and P. T. Briggs.
New York Fish and Game Journal, Vol. 23, No. 1, p 35-50, 1976, 9 tab, 3 fig, 12 ref.

Descriptors: *Fish populations, *Nuclear powerplants, Sites, Atlantic menhaden, Silversides, Fish, Seasonal, Pesticides, Chlorine, Trace elements, Thermal pollution, New York, Sounds.
Identifiers: Scup, Bluefish, *Long Island Sound(NY).

The purpose was to gather information on the species of fish found near the station site, their relative and seasonal abundance and their size ranges. The shore-zone waters serve seasonally as a nursery ground for several species, particularly Atlantic silverside and Atlantic menhaden. Near shore waters are important summer grounds for scup and juvenile bluefish. Specimens of two migratory (striped bass and juvenile bluefish) and one resident (windowpane) species examined showed low concentrations of DDT and its metabolites, dieldrin and trace metals. It was recommended that cooling water discharged into Long Island Sound should not exceed standards set forth by the State Department of Environmental Conservation, that shut downs for normal maintenance be scheduled at times other than winter months to prevent fishkill from sudden cold, and that the use of chlorine-bearing compounds to prevent fouling be undertaken with caution. (Chilton-ORNL)

OBSERVATIONS ON FISHES KILLED BY COLD AT PORT ARANSAS, TEXAS, 11-12 JANUARY 1973,
Texas Univ. at Austin, Port Aransas. Marine Science Inst.
R. H. Moore.
The Southwestern Naturalist, Vol. 20, No. 4, January 1976, p 461-466, 1 tab, 15 ref.

Descriptors: *Environmental effects, *Weather, Temperature, Fish, *Fishkill, *Thermal stress, Mortality, Estuaries, *Texas, Water temperature.

Cold-lethal temperatures for striped mullet, red drum, sheepshead, and most other common Texas estuarine fish appear to be about 4.5 C, while activity was severely limited at temperatures below 6-7.0 C. In the case of the cold front under discussion it was concluded that mortality due to cold was limited to fish trapped in enclosed waters such as marinas. Mortalities appeared to be due to the rapid decrease in temperature rather than to prolonged exposure to cold. Slower temperature decreases might have provided more time for acclimation and the observed cold-lethal temperatures might then be lowered. (Chilton-ORNL)

Gulf Research Reports, Vol. 5, No. 1, 1975, p 39-75, 9 fig, 5 tab, 51 ref.

Descriptors: *Fisheries, *Estuarine fisheries, *Crabs, Growth stages, *Overwintering sites, *Mississippi, Parasites.

670 samples obtained by trawl, seine, and marsh net from July 1971 through June 1973 were analyzed. Salinities ranging from 5.0 to 15.0 ppt at temperatures of 20.0 to 25.0 C were associated with highest average catches. Young crabs were most often found over soft mud bottoms in dredged navigational channels and marshes fringing the bays and coastline. Peak numbers of zoeae occurred in the summer and fall. Megalopae were found throughout the year but were most abundant in September 1970, February 1971, and August 1972. A tagging program in Lake Borgne in the fall of 1971 showed that crabs tagged and released in that vicinity moved into Mississippi Sound near Cat Island to overwinter while crabs released in the St. Louis Bay, Biloxi Bay and Pascagoula River estuarine systems showed little movement during spring and summer. Identified parasites included a new microphallid trematode. (Chilton-ORNL)

Descriptors: Biology, *Systematics, *Diatoms, *Atlantic Ocean.
Identifiers: *Sargasso Sea, *Skeletonema menzelii.

Skeletonema menzelii is related to S. costatum and S. tropicum but distinguished from them by smaller cell size, fragility of shells, shorter chain length, and irregular spacing of cells which are usually lenticular in shape. It has at most two chloroplasts per cell. The valves have 5-14 marginal strutted tubuli and a single, generally central labiate process. The valve has a pattern of fine radiate thickenings over a finely perforate silica membrane. (Chilton-ORNL)

Available from the National Technical Information Service, Springfield, VA 22161, as AD-A-009 032, $3.50 in paper copy, $3.00 in microfiche. Technical Report No. 185, June 1975. 15 p, 10 fig, 14 ref. NR 388 110. N00014-69-A-0211-0005.

Descriptors: *Barrier islands, *Currents(Water), *Alaska, *Beaches, Waves(Water), Beach erosion, Geomorphology, Inlets(Waterways), Tidal waters, Tides, Estuaries, Migration.
Identifiers: *Beaufort Sea, *Beach dynamics, *Nearshore morphology, Freezeup, Lagoon ice slush, Ice boulders, Frozen swash.

The beach dynamics and nearshore morphology of the Alaskan Beaufort Sea coast between Point Barrow and Demarcation Point were examined. The following conditions were found to exist: the beaches along the Beaufort Sea are subjected to wave and current action for a maximum of 3 months each year, and during this period they can be classified as wave-controlled forms. Beach volume changes during the open water period are increased by an order of magnitude during infrequent summer storms. Net longshore beach transport is toward the west and is about 10,000 cu m per year. Waves and currents have generated echelon offshore bars that occupy approximately 40% of the coast. The bars extend laterally from the shore to distances of 400 to 600 m seaward, they attain lengths of 2 to 10 km, and some are migrating westward at an average of 70 m per year. Their presence and migration have a pronounced effect on the beach and barrier island morphol
especially the width, and on the location
migration of the dynamic barrier inlets. The ba
islands are migrating westward at 6 to 25 m
year. On tundra islands, this migration result
permanent destruction of the tundra. If wave
tion persists into freezeup, then lagoon ice sl
ice boulders, frozen swash, foam and spray,
snow may be interbedded and preserved within
beach sediments. Later in freezeup, sea ice ri
may occur against the beach shorefast ice and
offshore bars, permitting the beach and bars t
readily discernible during winter by air recon
sance and from aerial photographs. (Lee-ISWS

Two-dimensional turbulent stratified shea
flow of lighter fluid flowing on top of an other
stationary ambient fluid of heavier density
simulated in the laboratory by letting fresh w
flow over the stationary body of saline water.
behavior of the turbulent surface layer was
served to depend on upstream condition as we
downstream condition in a manner similar to
free surface flow in open channel. Velocity
concentration were measured by hot
anemometer and conductivity probe. It was
served that a 'density jump' analogous to
open-channel hydraulic jump exists. Upstrea
the jump the flow was jet-like and was cha
terized by turbulent mixing and entrainm
similar to a neutral wall jet. This region
referred to as supercritical since it was observ
be influenced by the upstream condition
Downstream of the jump the flow was di
guished by sharp interface with negligible ent
ment. Mixing in the region of the density jump
more complicated. (Singh-ISWS)

asonal volumetric temperature/salinity dia-were prepared for the waters of the Middle Bight from Nantucket Shoals to Cape s, to a depth of 200 m and extending as 130 km beyond the edge of the continental otal volume included was 23,145.6 cu km, h about half is slope water, more saline ,000 mg/l. Most of it was in a distinctive ace maximum region near 13C, which is he upper slope water thermostat. The less helf water had two modes divided by a n near 33,600 mg/l. The fresher mode, as-sociated with shallow depths, was identified as coastal water; that from 33,600-35,000 mg/l was called shelf edge water, and much of it is found seaward of the shelf break. There was very little seasonal change in the total volume of shelf water, but its geographical distribution varied, showing the effects of spring runoff and suggesting a summer influx of slope water in the northern portion of the bight. Comparison with a similar census for the Gulf of Maine and shelf waters to the east showed some overlap, but little evidence of substantial exchange. (Henley-ISWS)

ANNOTATED BIBLIOGRAPHY ON THE GEOLOGIC, HYDRAULIC, AND ENGINEERING ASPECTS OF TIDAL INLETS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. H. Barwis.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A020 355, $3.50 in paper copy, $3.00 in microfiche. GITI Report 4, January 1976. 340 p.

Descriptors: *Bibliographies, *Inlets(Waterways), *Hydraulics, *Coasts, Abstracts, Publications, Channels, *Estuaries, Tides, Surface waters, Littoral, *Coastal engineering, Geology, Stratigraphy, Tidal effects, Engineering structures.

Abstracts and annotations were given for about 1000 published and unpublished reports, dated 1973 and earlier, on the geologic and engineering aspects of tidal inlets. Insofar as they relate to inlets, references were given on tidal hydraulics, engineering structures, littoral processes, stratigraphy and geologic history, coastal aerial photography, and Corps of Engineers reports of investigation of individual inlets. The bibliography was assembled and indexed to provide a basis for dialog between workers more familiar with the hydraulics and engineering literature, and those more familiar with the sedimentologic and geologic literature. The citations embraced a diverse range of subjects that are pertinent insofar as they aid comprehension of inlet-related phenomena. (Humphreys-ISWS)

A chart and attached text is designed for public users and developers of the California coastal zone as an easy reference and index to those policies of the Preliminary Coastal Plan which set forth criteria for development in the coastal zone. It is not intended to be used in lieu of the Plan, but rather as a guide to it. The chart is used to determine the type of development or activity involved

in the Preliminary Coastal Plan, to see what coastal resource values might be affected and to ascertain the policy intent and criteria. One hundred and eighty-two statement of policy intent are delineated. (Sinha-OEIS)

Identifiers: Coastal zone, Simulation models, Wind direction.

An assessment of the impact on water quality of a hurricane barrier across Rockaway Inlet, Jamaica Bay, New York is presented. Two simulation models for a barrier were considered. From simulations it was concluded that: the proposed hurricane barrier plans cause slight phase retardation in the tidal propagation in the Jamaica Bay system; the plans slightly decrease the counter-clockwise net circulation of the eastern portion of the bay by approximately 3% for both plans; the prevailing wind direction substantially influences the direction of the net circulation in the northwestern portion of the bay; the barrier has an insignificant influence on wind-induced circulation; the proposed barrier plans create no significant change in the transient (short-term) dispersion and transport of pollutants such as coliform bacteria discharged in the bay; with the Water Pollution Control Facilities around Jamaica Bay operating in the upgraded mode with 90% BOD removal, the amount of reduction creates negligible stress on the oxygen distribution in this area; and the construction of the barrier will induce only insignificant changes in the chloride concentrations and distributions as well as in concentration and distributions of conservative substances discharged in the bay from the present condition. A program in coastal dynamics has be developed to determine which beach a nearshore features are of interest to t researchers active in the coastal dynamic pr grams and to determine the extent to which the features can be mapped by remote sensi systems. Progress to date in using processi techniques to extract coastal bottom informa'i from passive multispectral scanner (MSS) da was presented in the July 15 through October 1 1975 quarterly report. A summary was presente on development of a reflectance model used to o tain information on coastal bottom composition Progress in the beach environment task was r ported. During the reporting period the lab anal sis on the thirty new beach samples was complet and the results loaded into a computer file f statistical analysis. The radar study is near completed. This task is a small effort of the tot program and deals with the problem of rock beach recognition. Various existing theories f equating radar backscatter to terrain roughne were explored. The strengths and shortcomings the various theories were studied. (Sims-ISWS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

THE IMPACT OF INCREASED FUEL COSTS AND INFLATION ON THE COST OF DESALTING SEA WATER AND BRACKISH WATERS,
Oak Ridge National Lab., Tenn.
S. A. Reed.
Report ORNL-TM-5070, December 1975, 25 p, 6 fig, 1 tab, append. W-7405-Eng-26.

Descriptors: *Desalination, *Costs, Desalination plants, Desalination processes, Cost analysis, Brackish water, Waste water treatment, Capital costs.

The rapid increase in the price of fuels and the escalation in all capital cost areas along with high interest rates during the last 3 to 5 years have had a marked impact on the cost of desalting saline waters. For 100 Mgd plant sizes, distillation plant capital costs have risen from $1 per daily gallon to $3 per daily gallon and for plant sizes of 5 Mgd or less from $1.40 per daily gallon to about $5 per daily gallon. Similarly, the costs for desalting brackish waters via electrodialysis, reverse osmosis, or ion exchange have increased significantly. The report presents the results of a parametric study to estimate the current costs of desalting sea water and brackish waters as a function of plant size and feed water chemistry. (Chilton-ORNL)

Economic and technological limitations of desalination for arid land development are mostly surmounted by use of brackish waters (i.e., those having a dissolved salt or solids content less than 15% of salt water). Various desalting techniques appropriate for brackish water purification are described, including the newer membrane and adsorption methods (reverse osmosis, electrodialysis and ion exchange). Such purification can be done at a moderate cost, is useful for a wide range of capacities and is simple enough to be viable under various arid conditions. Location and quality of brackish surface and ground waters are described using maps of the United States, Mexico and South America. Suggested development of these resources is outlined for Latin America; priorities include mapping of brackish water resources in the arid regions, establishment of regional desalting test stations and advanced research and development programs. A comprehensive and systematic approach is emphasized. (Jahns-Arizona)

SEA WATER DESALINATION APPARATUS,
Snam Progetti S.p.A., Milan (Italy). (Assignee).
G. Pagani.
U. S. Patent No. 3,961,658, 4 p, 5 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 624, June 8, 1976.

Descriptors: *Patents, *Desalination, *Water purification, *Water quality control, Sea water, Distilation, Long-tube vertical distillation, Desalination apparatus, Evaporators, Condensers.
Identifiers: Multiple-effect distillation.

An apparatus for the desalination of sea water is comprised of a column of a number of superposed cylindrical sections. Each section includes two film evaporators, two basins, interconneced between the cylindrical sections, a restriction for passing brine from basin to basin, siphon tubes for withdrawing the condensed water from each section and accessory preheating means and inlet and outlet tubes. This invention is a multiple-effect distillation process based on the principle of evaporation and succeeding condensation. The vapor produced in one stage is permitted to condense in the following stage for producing vapor at a lower thermal level and so on for all the other stages. (Sinha-OEIS)

U. S. Patent No. 3,963,619, 5 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 947, No 3, p 1264, June 15, 1976.

Descriptors: *Patents, *Desalination, *Water purification, *Water treatment, *Desalination apparatus, *Scaling, Sea water, Potable water.
Identifiers: Seed crystals.

Apparatus for producing fresh water from sea water or briny water which operates on the evaporation-distillation principle has a limited capacity owing to upper temperature and operating limits imposed by scaling. This invention relates to a device of simple design for decanting crude sea water solutions containing the scaling salts and which lends itself to use in combination with conventional apparatus used in desalination processes. An apparatus for separating solids from a liquid suspension using an evaporator/decanter has an outer and inner vessel and an inverted fun-

nel member housed within the inner vessel, the leg of the funnel extending through the top of the inner vessel. A gutter member, mounted around the inner circumference of the inner vessel collects the clarified water. In a process for removing scaling agents from sea water, seed crystals are added to the sea water which is then heated to a temperature above the solubility limits of the scaling agents and above the operating temperatures of a desalination unit to cause the scaling agent to crystallize on the seed crystals. The seed crystal solution is then fed into the outer vessel of the apparatus to effect removal of the crystals and produce a clarified sea water feed for the desalination unit. (Sinha-OEIS)

Available from the National Technical Information Service, Springfield, VA 22161 as AD-A022 470, $4.50 in paper copy, $3.00 in microfiche. Final Report, January 1976. 62 p, 11 fig, 4 tab, 26 ref, 2 append. ARO DAHC04-73-C-0001.

Descriptors: *Model studies, *Precipitation(Atmospheric), *Forecasting, *Weather modification, Mathematical models, Rainfall, Atmosphere, Atmospheric physics, Cloud physics, Cloud seeding, Finite element analysis, Condensation, Meteorology.

A fine-mesh limited area model was developed both to predict precipitation over a limited geographic region, and to be utilized in experiments with precipitation modification. The model utilized the primitive equations, incorporated fifteen levels in the vertical, and had a basic grid length of 80 km. It showed many of the features of current models of its type, but lacked resolution in the boundary layer. Lateral boundary conditions were specified when needed from a data set which also provided initial conditions and comparisons for the forecasts. Finite-difference integrations were performed but spectral techniques were studied. Forecasts with the model showed some fidelity to observations but some short-comings also. Setting one integration as a control, a number of experiments were performed with model modifications and compared to the control. In all cases, modification did not substantially alter the flow field over a 24 hour period. Precipitation forecasts were altered however. By reducing condensation related to cloud top temperature, implying lack of freezing nuclei, regions of marginal precipitation showed almost no precipitation. With enhanced condensation based on cloud seeding, these regions showed significant increase in precipitation. The addition of carbon black to the model for heating did not show substantial changes in precipitation. Modified initial conditions based on poor (coarse grid) resolution has a significant effect on precipitation predictions. (Sims-ISWS)

3C. Use Of Water Of Impaired Quality

THE VEGETATION OF DUNE SLACKS AT NEWBOROUGH WARREN: III. PLANTAGO CORONOPUS,
Nigeria Univ., Nsukka. Dept. of Botany.
S. S. C. Onyekwelu.
J Ecol. 60(3), p 907-916, 1972.

Descriptors: *Vegetation, *Phosphorus, *Nitrogen, *Germination, Dunes, Topography, Ecology, Sea water, Salts.
Identifiers: *Plantago-Coronopus, *Wales, *Dune slacks.

Some aspects of the autecology of P. coronopus were studied (at Anglesey, Wales) by pattern analysis technique and experiment. The scale of pattern exhibited was related to microtopography. Experimental studies show a better performance at lower water tables. The poor performance in the dune slacks is attributed to low N and P status. Germination is retarded in the dark and with increase in soil depth. There is no effect on germination when the seeds are chilled, and though there is no germination in 50% sea water, the high salt content shows no considerable injury to the seeds. There is no fall of viability with storage.--Copyright 1973, Biological Abstracts, Inc.

FALLS IMIS PROJECT. WATER
PROCESSING SYSTEM APPLICA-
LUATION REPORT,
niv., Lawrence. Inst. for Social and En-
al Studies.
rds, and J. Zelinka.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 827, $5.50 in paper copy, $3.00 in microfiche. Report USAC-WFT 2-5016, Prepared for the Department of Housing and Urban Development, April 1975. 113 p, 1 fig, 66 tab, 5 append. H-1217.

Descriptors: *Evaluation, *Information exchange, *Management, *Accounting, Finance, Cities, Cost-benefit analysis, Cost analysis, *Texas.
Identifiers: *Integrated Municipal Information System(IMIS), *Urban Systems Advisory Committee(USAC), *Water Utility Processing System(WUPS), *Wichita Falls(TX), Municipal information systems.

The specific Integrated Municipal Information System (IMIS) project in Wichita Falls was the Water Utility Processing System (WUPS) operating in the Utility Collections Department concerned with meter reading, service change order processing, cash collection and customer servicing, accounts reporting, accounts auditing and ledger 'A' accounts processing. Impacts of implementation were evaluated in regard to manpower cost, efficiency and function; users of the system; and other municipal activities. Installation of WUPS caused: (1) initial disruption of service as personnel learned the automated system; (2) slight savings in labor and manpower costs; (3) more accessible and reliable financial and non-financial information; (4) increased integration of official city and private business operations due to this previously unwieldy data base; (5) increased analytical capacity encouraging more accurate and efficient municipal activities. Long run efficiencies occurred in meter reading which was simplified and streamlined by automatic routing and continuous development of contiguous books; data entry and retrieval; information processing where billing and information storage errors are reduced; and data analysis is facilitated by extensive and current reports and lists. WATER FOR INDUSTRIAL AND AGRICULTURAL DEVELOPMENT IN COAHOMA, DE SOTO, PANOLA, QUITMAN, TATE, AND TUNICA COUNTIES, MISSISSIPPI,
Geological Survey, Jackson, Miss.
G. J. Dalsin, and J. M. Bettandorff.
Mississippi Research and Development Center, Jackson, Miss., 1976. 87 p, 27 fig, 16 tab, 39 ref, append.

Descriptors: *Water resources development, *Industrial water, *Agriculture, *Mississippi, *Hydrologic data, Water utilization, Surface waters, Groundwater, Streamflow, Aquifer characteristics, Water yield, Water wells, Hydrogeology, Water quality, *Water supply, Available water, Projections, Surface-groundwater relationships.
Identifiers: Northwest Mississippi.

Ground water is the major source of industrial and agricultural water supplies in Coahoma, De Soto, Panola, Quitman, Tate, and Tunica Counties, Miss. 33 million gallons per day (mgd) were used for public and industrial supply in 1973; irrigation use for the year was 39,000 acre-feet. Average runoff contributed to river basins in the study area is 2,600 mgd. The average flow of the Mississippi River is 297 billion gallons per day. Sardis, Enid, and Arkabutla Lakes have a combined conservation storage of 197,000 acre-feet and can hold more than 2.5 million acre-feet. The fresh-groundwater section is 800 to 3,000 feet thick. Tertiary aquifers, the major source of public, industrial, and domestic water supplies, are capable of supplying 1 million gallons of water per day or more to well fields in most places. The Mississippi River valley alluvial aquifer supplies water for irrigation, cooling, and industrial uses. Well fields can supply several million gallons per day. Ground water is highly mineralized in downdip areas of the Tertiary aquifers. Iron and low pH cause problems locally in water supplies. Water in the Mississippi River valley alluvial aquifer is hard and contains excessive iron. (Woodard-USGS)

WATER REQUIRED TO DEVELOP GEOTHERMAL ENERGY,
Texas University at Austin. Geothermal Studies.
M. H. Dorfman.
American Water Works Association Journal, Vol. 68, No. 7, p 370-374, July 1976. 7 fig, 22 ref.

Descriptors: *Geothermal studies, *Temperature, *Thermal properties, Environmental effects, Brines, Boron, Potash, Lithium, Land subsidence, Potable water, Geysers, Hot springs, Steam, Subsurface waters, Drilling equipment, Drilling fluids, California, *Energy.
Identifiers: Vapor-dominated connective systems, Liquid-dominated connective systems, High-enthalpy brines, Low-enthalpy fluids, Geopressured sands, Continental plates, Plate tectonics, Subduction zones, Crustal spreading, Italy, Mexico.

World wide distribution of geothermal resources may be identified within the framework of geologic mode of occurrence. Vapor-dominated connective systems are found in areas of plate convergence. Liquid-dominated connective systems, made up of high-enthalpy brines, are found in areas of crustal spreading. Low-enthalpy fluids are found at moderate to great depths in geopressured sands in subsiding sedimentary basins. Water needs for development of geothermal resources are minimal and are usually available. Water production presents varied problems however, depending upon the type of geothermal system. Vapor systems are sulfur rich and require protection against corrosion. Hot brines found in liquid systems are chlorine rich and require scaling and corrosion protection. Large-scale geothermal development may lead to development of mineral-extraction industries. Vapor system fluids are often rich in boron compounds and liquid system brines contain potash, lithium and other useful minerals. Potable water for irrigation may become an important by-product geothermal energy development. Subsidence problems from geothermal fluids will require additional research to determine the extent of the problem and develop methods of mitigating its effects. Geothermal areas appear to represent a useful source of energy

with worldwide distribution. It is anticipated that geothermal energy will represent an increasing fraction of total energy supply as petroleum availability diminishes. (Heiss-NWWA)

SEDIMENT FROM DRAINAGE SYSTEMS FOR A HEAVY SOIL,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
G. O. Schwab, B. H. Nolte, and R. D. Brehm.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-18, 1975, Chicago, Illinois. 7 p, 3 fig, 2 tab, 10 ref. ASAE Paper 75-2549

Descriptors: *Sediment discharge, *Sediment load, *Sediment transport, *Sediment yield, *Drainage, Drainage practices, *Drainage systems, Drains, Ohio, Tile drains, Soils.

Sediment losses from tile and surface drainage systems in a lakebed soil in northern Ohio were measured for 6 years (1969-74). Average annual losses were 2369 Kgs/Ha from tile only and 3710 Kgs/Ha for surface only. Expected losses for the combination tile and surface drainage system were 3260 Kgs/Ha. Losses ranged from about 200 to 900 Kgs/Ha annually. Average net losses from sprinkler irrigation were negligible and usualy more sediment was added than removed in the drainage water. Sediment concentration in tile flow from irrigation increased significantly with the antecedent soil moisture content. Concentrations were high at the beginning of flow but decreased to a nearly constant level after 20 hours. A possible explanation for the high concentrations is that the sediment moved in suspension with the water and not through the soil cracks. The total estimated soil loss from the surface drained only plots was within one percent of the measured losses. The estimated losses were computed from the universal soil loss equation. For the no-till plots the estimated losses were 16 percent higher than than the measured whereas conventional tillage losses were 11 percent lower. A linear regression was significant at the 99% level. EStimates using ant runoff factor rather than the rainfall factor in the soil loss equation were 41 percent of the measured values compared to 89 percent using the rainfall factor. IRRIGATION SCHEDULING AND SUGARBEET PRODUCTION,
Northern Ohio Sugar Co., Fremont, Ohio.
G. D. Jardine, and S. D. Fox.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-19, 1975, Chicago, Illinois. 6 p, 4 tab, 6 ref. ASAE Paper 75-2556.

Descriptors: *Sugarbeets, Irrigation, Irrigation practices, Crop response, Colorado, Soil moisture, Irrigation efficiency, *Scheduling, Crop production.
Identifiers: *Irrigation scheduling.

Irrigation scheduling and sugarbeet production are discussed. The emphasis is upon the results of Great Western Sugar Company's irrigation studies and the recommendations for a successful sugarbeet irrigation program. Recommendations are: (1) begin the season with a full or nearly full soil moisture profile; (2) give the crop a boost with light irrigations for emergence and after thinning, if necessary; (3) schedule irrigations throughout the season using climate, crop, and soil data. Also, include the irrigators experience and habits where possible in determining the actual schedule; and (4) utilize irrigation scheduling to determine the cut-off dates for late season irrigations. These recommendations all point toward managing the soil moisture so the maximum sugar production can be attained by utilizing all the resources ava ble to the grower. Today's sugarbeet grower n be a good manager. All tools researchers can p vide to better manage irrigations will help in the continued production of high yielding, h quality, sugarbeets. TRICKLE AND SPRINKLER IRRIGATION GRAIN SORGHUM,
Texas A and M Univ., College Station. Dep Agricultural Engineering.
C. J. Ravelo, E. A. Hiler, and T. A. Howell.
Presented at the 1975 Winter Meeting of the A ican Society of the Agricultural Engine December 15-18, 1975, Chicago, Illinois. 17 fig, 3 tab, 15 ref. ASAE Paper 75-2574.

Descriptors: *Crop response, *Sorgh *Irrigation practices, *Irrigation effe *Sprinkler irrigation, Irrigation systems, *C sorghum.
Identifiers: *Drip irrigation, *Trickle irrigatio rigation frequency.

The crop response and water use efficiency (of weight of grain harvested to centimeters of crop water use) of grain sorghum was investig using trickle and sprinkler irrigation. Also th fects of different trickle irrigation frequencie the crop growth and ultimate grain yield were died. Two different experimental investigat are reported one conducted in 1972 and anoth 1974. The 1972 sprinkler vs. trickle experimen the following two irrigation treatments with t replications each: (1) trickle irrigated three t per week, and (2) overhead sprinkler irri three times per week. The irrigation amoun each treatment were 1.1 times soil water loss measured by the neutron method with gravim sampling in the upper 10 cm. The 1974 trick rigation frequency experiment had the follo three treatments with three replications each trickle irrigated thrice weekly, (2) trickle irri twice weekly, and (3) trickle irrigated weekly. From the results of these experiment vestigations and for the given conditions of study, the following conclusions can be drawn There were no significant differences in yie water use efficiency when using trickle and s kler irrigation with a thrice-weekly frequency (2) Different trickle irrigation frequencies (twice, and thrice weekly) with the same overa plication amounts had no significant effec grain sorghum yield or water use efficie (Skogerboe-Colorado State).

Descriptors: *Oxygen, *Crop response, *Soil tests, Soil investigations, Soil environment, Soil horizons, Soil moisture, *Cultivation.
Identifiers: *Tillage effects, *Matric potential, *Millet.

A unique relationship was established between soil O2 content and soil water matric potential from which the O2 content may be estimated from soil matric potential data. Yield of millet was a function of soil O2 content from 2 to approximately 15%. At soil O2 levels greater than 15%, the growth of millet was independent of soil O2 content. Harvesting millet twice during the growing season which included a 14-day wet period produced significantly greater yields than harvesting three times. Chiseling the soil 35 cm deep one year before the experiment resulted in yields greater than those of the plowed soil, when the soil was in a wet condition, simulating a stormy 14-day period. Under a moderate soil water regime, in which the soil matric potential did not exceed -400 mb, aeration was adequate and the yield of millet was unaffected by tillage depth. Under high matric potential conditions, -45 to -87 mb, chiseling was beneficial as a means of partially alleviating soil oxygen stresses associated with a wet soil condition. WATER USE BY DRYLAND CORN AS AFFECTED BY MATURITY CLASS AND PLANT SPACING,
Agricultural Research Service, Mandan, N. D. Northern Great Plains Research Center.
J. Alessi, and J. F. Power.
Agronomy Journal, Vol. 68, No. 4, p 547-500, July-August 1976. 3 fig, 4 tab, 12 ref.

Descriptors: *Water utilization, *Corn(Field), *Mature growth stage, *Crop response, Crop production, Soil water, Evapotranspiration, Plant populations, Soil-water-plant relationships, Efficiencies.

A study was conducted at Mandan, N. D., to determine the effects of row spacing and plant population on growth and water use by early dryland corn (Zea mays L.) hybrids. For 3 years, 68- and 85-day relative maturity class hybrids were grown at plant populations of 20, 30, 40, 60 and 74 thousand plants/ha in 50- and 100-cm rows on Temvik silt loam (Typic haploboroll). Soil water content was not affected by row spacing or location of the access tube with respect to the row. Water withdrawal by the crop was usually in the upper 90-cm soil depth, regardless of treatment. Greater populations generally increased water use during vegetative growth, leaving less water for reproductive growth. Soil water depletion was greater during the early growing season than after midseason when water use was highly dependent on precipitation. Water use efficiency was highest at a population of 40,000 plants, except for dry-matter production by the 85-RM hybrid at the largest population. The early maturing hybrid was more efficient in water use for grain production, while the later maturing hybrid was more efficient for forage production. The early maturing hybrid may also be less affected by severe drought. (Jahns-Arizona)

GENOTYPE VARIATION IN NUTRIENT UPTAKE EFFICIENCY IN CORN,
New York State Univ. Agriculture and Technology Coll. at Cobleskill.
T. F. Bruetsch, and G. O. Estes.
Agronomy Journal, Vol 68, No 3, p 521-523, May-June 1976. 2 tab, 19 ref.

Descriptors: *Corn(Field), *Plant growth, *Nutrient requirements, Mature growth stage, Phosphorus, Root systems, Root development, *Absorption.
Identifiers: *Nutrient uptake(Corn), Dry matter.

Nutrient uptake varied significantly for 12 corn genotypes of commercial importance and of varying maturity under field conditions. Relative maturity was based on the percentage of dry matter (% DM) after 115 days of growth. There were significant positive correlations between % DM and foliage P concentration and content, indicating that earlier maturing genotypes had higher P levels. Genotypes varied in terms of dry weight production per gram of N, P, K, Ca and Mg absorbed, with the relationship between P concentration and relative maturity being most consistent. A significant negative correlation between % DM and DM/g of P absorbed indicated more efficient P use by the later maturing corn lines in terms of dry matter production. Such response may be due to the ability of roots to penetrate soil and physically contact more soil P. (Jahns-Arizona)

IRRIGATION SYSTEM CONTROLLER,
International Electric Corp., Chicago, Ill. (Assignee).
C. K. Sears.
U. S. Patent No. 3,961,753, 11 p, 8 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 655-656, June 8, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Distribution systems, *Irrigation efficiency, *Monitoring, Instrumentation, Orchards, Citrus fruits, Moisture content, Moisture meters.
Identifiers: Drip irrigation.

An irrigation system controller operationally ties the dispensing of water to the soil directly to its need without requiring continuous monitoring by the irrigation manager. If a preselected water supply period is not sufficient to attain a desired moisture content in the soil due either to an insufficient estimate on the part of the manager or a power or equipment failure or unforeseen change in weather, a warning device or other electrically-operated signal calls attention to the need for the selection of a new longer water supply period or a correction of the power or equipment failure. A pushbutton switch resets the warning system. If the preselected water supply period is sufficient to maintain the desired moisture content, a feed-back loop automatically controls the dispensation of water to maintain the desired moisture content of the soil. thunderstorm precipitation on the after-July 3, 1975, between metropolitan Las nd the mountains to the south, west, and nused flash flooding in the city area. Total recipitation equaled or exceeded 3 inches areas. The total storm yield on the area of nt runoff was probably between 20,000 00 acre-feet of water. Of this amount, less than 3,000 acre-feet flowed directly Mead. Peak flows of Tropicana Wash, Flamingo Wash, Las Vegas Creek, and Las Vegas Wash were the highest ever determined. Flooding caused the loss of two lives and inflicted extensive property damage. Total damage was reportedly estimated by the Clark County Flood Control District at $4-5 million. Problems associated with sediment erosion, transportation, and deposition occurred throughout the flooded area. An unknown amount of the material transported during the flood was deposited in Lake Mead near the mouth of Las Vegas Wash. Lateral erosion appeared more prominent than vertical erosion along most major channels, except on Las Vegas Wash at Northshore Road where downcutting threatened the loss of the highway. Sediment deposits were particularly noticeable and troublesome in Flamingo Wash at Caesars Palace parking lot and on the Winterwood Golf Course near the junction of Flamingo Wash and Las Vegas Wash. PLAN OF WORK, RED RIVER BASIN ABOVE DENISON DAM.
Soil Conservation Service, Temple, Tex.
Type IV Cooperative River Basin Survey, July 1975. 60 p, 2 fig.

Descriptors: *River basins, *Surveys, *Planning, *Texas, *Oklahoma, Rivers, Watersheds(Basins), Dams, Basins, Water supply, Water quality, Surface waters, Water resources, Agriculture, Forests, Drainage, Economics, Recreation, Land use, Environment, Evaluation, Projects, River basin development.
Identifiers: *Red River Basin(Tex-Okla), *Denison Dam(Tex-Okla).

The Red River Basin Above Denison Dam extends from eastern New Mexico across the Texas Panhandle to Denison Dam on the Oklahoma-Texas boundary. In 1970 and 1971, the U.S. Department of Agriculture received requests from the Oklahoma Conservation Commission, the Oklahoma Water Resources Board, the Texas Water Development Board, the Texas State Soil and Water Conservation Board, and the Texas Water Rights Commission to participate in a Type IV cooperative study of the Red River Basin Above Denison Dam. The overall objective of the study was to determine the capability of water and land resource projects and programs for solving problems and meeting needs of the basin. The U.S. Department of Agriculture agreed to participate under the authority and provisions of Section 6 of Public Law 83-566, as amended. It was essential that plans for water and land resource development in the Red River Basin Above Denison Dam be compatible with the principles, objectives, plans, and programs in Oklahoma and Texas, respectively. It was also essential that the plans finally developed be compatible with efficient and effective land treatment programs, water management, administration, and supervision under applicable State and Federal authorizations and responsibilities. Institutul de Meteorologie si Hidrologie, Bucharest (Rumania).
C. Diaconu, and V. Al. Stanescu.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 77-80, March 1976. 1 fig, 1 tab.

Descriptors: *Mathematical models, *Flood waves, *Basins, *Forecasting, Model studies, Runoff, Warning systems, Precipitation, Hydrologic cycle, Equations, Runoff forecasting.
Identifiers: *Target basin, *Romania, *Flood wave forecasting, *Mures River, Warning basins, Fortran IV, Precipitation components.

An approach was proposed to eliminate the difficulties surrounding the direct use of precipitation components to forecast runoff. Precipitation data and runoff coefficients were obtained for small selected warning basins in the forecast area (target basin), and the runoff from the warning basins was accurately determined. These values were routed into the runoff values of the target basin using a modified isochrone method. The damping effect of the flow of the network was taken into account. An algorithm for the runoff of the target basin was given. The computation was done using Fortran IV, and examples of computed and actual hydrographs were given for the flood on the Mures River in May 1970. (Roberts-ISWS)

COMPARISON OF REQUIRED RESERVOIR STORAGES COMPUTED BY THE THOMAS-FIERING MODEL AND THE 'KARLSRUHE MODEL' TYPE A AND B,
Karlsruhe Univ. (West Germany). Institut fuer Wasserbau III.
B. Treiber, and G. A. Schultz.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 177-185, March 1976. 5 fig, 4 tab, 6 ref.

Descriptors: *Reservoir storage, *Synthetic hydrology, *Model studies, Computers, *Reservoir yield, Laboratory tests, Graphical analysis, Flows, Hydrologic data, Analytical techniques, Hydrology.
Identifiers: *Thomas-Fiering model, *Karlsruhe model, *Black Forest mountains, Hurst coefficient.

Design of water supply reservoirs, i.e. the determination of required reservoir capacity, often requires use of the Rippl method on the basis of observed monthly flow data. This technique has two major drawbacks: (1) the observed data are subject to sampling errors influencing the design results, (2) the coarse time discretization produces too small required reservoir capacities. In order to reduce the sampling errors, designs are often based on many time series of synthetically generated data. There are several models available which generate monthly flow data. The results when using the Thomas-Fiering model and when using the Karlsruhe generating model, type A, were compared. Reservoir capacities were also determined using Karlsruhe model, type B, for daily flows. For a reservoir in the Black Forest Mountains in south Germany, the reservoir capacities were shown to be higher with the Thomas-Fiering model and lower with the Karlsruhe model than those capacities given by the 45 years historical data of monthly flows. When the Karlsruhe model with daily flows was used, the desired capacities at full development were about 2 to 5% higher than with the monthly flows. The capacities were shown to be substantially higher with daily flows if the level of development was only 44%. (Singh-ISWS)

Identifiers: *Washita River, *Floodwater retarding structure.

The upstream watershed-protection and flood-prevention program of the Soil Conservation Service is very important to agriculture. Knowledge of the magnitude of impact of the program on downstream runoff yield in water-scarce areas is also important. One of the primary program elements, the floodwater-retarding structure (FRS), has potential impact on yield of surface runoff. Reliable yield impact estimates are needed to protect downstream users and to avoid excessive restrictions on the upstream programs. Published information on downstream impact of FRS was reviewed and analyzed. The information found was neither satisfactory nor accurate enough for the Oklahoma-Texas area, where most of the structures and most of the concern about downstream impact are located. PORTABLE, ADJUSTABLE FLOW-MEASURING FLUME FOR SMALL CANALS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
J. A. Replogle.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-18, 1975, Chicago, Illinois. 25 p. 5 fig, 2 append, 5 ref. ASAE Paper 75-2558.

Descriptors: *Flow measurement, *Flumes, *Portability, *Water measurement, Flow rates, Water conservation, Canals, *Irrigation canals.
Identifiers: *Portable flumes.

A portable flume-site survey flume was constructed and used to verify siting of permanent metering flumes. The portable system consists of a trapezoidal throat that can be raised and lowered in a flowing field ditch to establish limits of unsubmerged operation and backwater effects on upstream structures. Mechanical solutions to problems of maintaining gage-zero on a movable throated flume, stilling well readout, and movable seals between ditch and flume were presented. A family of concrete throat sections, differing only in height of installation from the flume floor, were recommended for the permanent installations. Flows between about 0.5 cfs (0.01 m3/s) and 25 (0.7 m3/s) can be measured with the port system. Satisfactory operation can be achie with less than 4 inches (10 cm) head loss to canal system. Permanent structures can be stalled with high assurance that they will ope as intended, be convenient enough to be routi used and rugged enough to remain reliable and curate. FLOOD PLAIN INFORMATION, LOWER BUFFALO CREEK AND ITS TRIBUTARIES, NAHUNTA AND BRANTLEY COUNTY, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for Nahunta and Brantley County, Georgia, October 1972. 28 p, 53 plates, 11 fig, 5 tab.

Descriptors: *Floods, *Flood plains, *Flood profiles, *Flow duration, *Streamflow Forecasting, *Georgia), Storms, Hurricanes, Historic floods, Flood frequency, Flood stages, Flood peak, Flow characteristics, Warning systems.
Identifiers: *Buffalo Creek(Ga), Nahunta(GA), Brantley County(GA), Satilla River(GA), Standard Project Flood, Intermediate Regional Flood.

Buffalo Creek, a tributary of the Satilla River, with a drainage area of 160 square miles, subjects portions of the city of Nahunta and Brantley County to periodic flooding. With average slopes of 3.5 feet per mile, Buffalo Creek and its tributaries have flood plains which are largely undeveloped, currently heavily wooded and swampy. Several homes and businesses in the vicinity of Nahunta are subject to periodic flooding. Bridges, culverts, sand and soil deposits, and vegetation can obstruct floodflows. Seven large floods have occurred since 1929 as the result of thunderstorms, general rainstorms, and hurricanes or tropical storms. The most recent serious flooding occurred in 1969 when flood heights reached 38.7 feet above mean sea level and caused severe damage in the study area. The Intermediate Regional Flood and the Standard Project Flood would reach heights of 40.5 ft and 45.5 above MSL, respectively, and would have peak discharges of 6,440 and 16,100 cubic feet per second, respectively, on Buffalo Creek at Road B. The IRF would typically rise 10 feet in 12 hours and remain above bankfull 24 hours. Channel and overbank velocities would reach 6 and 14 feet per second, respectively. Considerable damage would be caused by an IRF. The SPF can be expected to rise 15 feet in 18 hours and remain above bankfull for 48 hours. Due to the wider extent, greater depths of flooding, higher velocity and longer duration of flooding, the Standard Project Flood would be disastrous. The National Weather Service issues flood warnings for the area. There are no existing city or county flood ordinances. (Henley, North Carolna.)

FLOOD PLAIN INFORMATION: SCIOTO AND OLENTANGY RIVERS, OHIO, CHILLICOTHE AREA SUMMARY REPORT,
Army Engineer District, Huntington, W. Va.
Prepared by Dodson, Kinney and Lindblom, consulting engineers, Columbus, Ohio, for the Ohio Department of Natural Resources, October 1966. 19 p, 14 fig, 6 plates.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Ohio, Flood data, Historic floods, Flood protection, Non-structural alternatives, Control structures.
Identifiers: *Scioto River(OH), *Olentangy River(OH), *Chillicothe(OH).

This summary of a main report covers the Scioto River, Paint Creek and North Fork flood plains in the Chillicothe area. The population of Ross County is expected to increase by only a third between 1960 and 1985 with anticipated growth in flood plain areas. The Chillicothe flood plain, the second largest flood damage center in the Scioto River Basin, contains residential and commercial development which would be inundated by backwater flooding from Scioto River or from headwater flooding on Paint Creek and result in costly damages. The greatest flood in March 1913 caused $2.5 million damages, and 18 lives were lost. A flood of this magnitude today would cause damages of $30 million. Although the Delaware Reservoir (OH) has partly reduced flooding, a major flood on the Scioto River in January 1959, cresting at 7 feet below the 1913 flood and having half the flood flow, caused extensive damages. Severe damages to railroad structures and highways resulted from flooding in March 1963 and March 1964 on Paint Creek. Flood control proposals include 6 reservoirs, one of which is completed (the Delaware Reservoir in 1951), floodwalls, levees, and pumping stations. Existing flood plain management controls include Chillicothe's zoning regulations which could be used effectively to control flood plain developments. Guidelines for reducing future flood damages are described and include flood control works and flood plain management. (Salzman-North Carolina).

FLOOD PLAIN INFORMATION: VERDIGRIS, FALL AND ELK RIVERS, KANSAS.
Army Engineer District, Tulsa, Okla.
Prepared for the Kansas Water Resources Board, State of Kansas, Topeka, Kansas, January 1966. 39 p, 5 fig, 25 plates, 20 tab, 34 ref.

Descriptors: *Floods, *Flood forecasting, *Flood profiles, Historic floods, Flood data, *Flood plains, *Kansas, Floodwater, Flooding, Flash flood, Streamflow forecasting, Maximum probable flood, Peak discharge, Levee, Dams, Reservoirs.
Identifiers: *Verdigris River(KS), *Fall River(KS), *Elk River(KS), Coffeyville(KS), Coyville(KS), Altoona(KS), Frendonia(KS), Elk City(KS), Independence(KS), Lenapah(OK), Standard Project Flood.

This study covers the southeast corner of Kansas including several towns and villages plus extensive agricultural areas. Fall and Elk Rivers, with drainage areas of 884 and 702 square miles, respectively, are principal tributaries of the Verdigris River which drains 3,354 sq mi. They are streams of generally low slope which join the Arkansas River in Oklahoma. The comparatively flat valleys of the these streams have been subject to frequent and extensive flooding. Excessive rainfall in months April through November is the chief cause of flooding. Flash floods sometimes occur. At least 6 major floods have occurred since 1885, the largest on the Verdigris River being the 1951 flood, and on the Elk River, the 1961 flood. Peak discharges recorded have been 130,000 cubic feet per second on the Verdigris River (1951), 49,000 cfs on the Fall River (1945), and 100,000 cfs on the Elk River (1961). No detailed record of damages is given in this report. It is estimated that the Fall River and Tornoto Reservoirs have prevented about $13 million in damages through 1966. The Elk City and Big Hill Reservoirs were scheduled for completion in 1966 and 1970. It is estimated that with the four reservoirs in place bankfill capacity would be exceeded once in 2 years in Independence, KS, compared to more than twice a year without the reservoirs. On the Verdigris it is estimated that peak discharges of 64,000 cfs and 139,000 cfs would occur at the lower end of the study area during a 50 year flood and Standard Project Flood. Corresponding figures for the Fall River are 37,000 cfs and 104,000 cfs, and for the Elk River, 15,500 cfs and 29,400 cfs respectively. (Smith-North Carolina)

FLOOD HAZARD ANALYSES: ROYAL RIVER AND CHANDLER BROOK, TOWN OF NORTH YARMOUTH, MAINE.
Soil Conservation Service, Washington, D.C.
Prepared for the Town of North Yarmouth, Maine. June 1975. 46 p, 4 fig, 13 plates, 2 tab, 2 append.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Maine, Streamflow forecasting, Flood forecasting, Historic floods, Flood data, Peak discharge, Non-structural alternatives, Zoning, Control structures.
Identifiers: *Royal River(ME), Chandler Brook(ME), *North Yarmouth(ME), 100-year flood, 500-year flood.

In the watershed, dairying is the principal enterprise. Little land is devoted to uses other than agriculture and woodland, though development pressure in North Yarmouth is increasing. Chandler Brook with a drainage area of 52 square miles is a tributary of Royal River which drains 142 sq mi. For the state of Maine as a whole, most floods occur in months March through April, and November, with the rest of the floods distributed throughout the remaining portion of the year. Streamgage records, available for Yarmouth since 1949, indicate the largest flood occurred in September 1954 when Hurricane Edna passed through the state and 7.49 inches of rain were measured at Portland ME. The peak discharge was 7,960 cubic feet per second, approximately a 100 year frequency. In November 1966 a discharge of 5,040 cfs was recorded, an 8 year frequency. In 1954 damage was estimated at $40,000 on highways and bridges throughout the watershed along with scattered commercial and residential properties. Results of surveys and calculations indicate peak discharges in a 100 year flood would be 8,000 cfs on Royal River, at confluence with Chandler Brook, and 3,950 cfs on Chandler Brook at the same location. In a 500 year flood, peak discharges of 9,600 cfs and 4,950 cfs are predicted for Royal River and Chandler Brook, respectively. Maine has adopted a Mandatory Zoning and Subdivision Control Law which requires municipal adoption of zoning and subdivision control ordinances for shoreline areas within 250 feet of the normal high water mark of any pond, river or salt water body. An appendix of this report contains a model zoning ordinance. (Smith-North Carolina)

ESTIMATING PEAK DISCHARGES FROM SMALL DRAINAGES IN NEVADA ACCORDING TO BASIN AREAS WITHIN ELEVATION ZONES,
Geological Survey, Carson City, Nev.
D. O. Moore.
Nevada Highway Department, Carson City, Hydrologic Report No 3, 1976. 17 p, 4 fig, 4 tab, 2 ref.

Descriptors: *Streamflow, *Peak discharge, *Estimating, *Small watersheds, *Nevada, Analytical techniques, Data collections, Hydrologic data, Elevation, Correlation analysis.
Identifiers: Empirical relations.

Streamflow records were used to define empirical relations between the 10-year peak discharge and 1,000-foot elevation zones for drainage basins less than 150 square miles in Nevada. The data indicated there were two hydrologically homogeneous regions, one for northern Nevada and one for southern Nevada, with respect to the 10-year peak discharge and basin area within elevation zones. Therefore, an empirical relation was developed for each of the two regions. Peak discharges from ungaged drainages in each region can be estimated on the basis of the derived relation for the region in which the basin lies. The standard error of estimate is approximately 22 percent in the north and 35 percent in the south. The method is particularly useful in Nevada which is a semi-arid region of large relief where the relation between peak discharges and total drainage area is not well defined. The method does not appear to give reliable results when large parts of the drainage basin lie on the valley floor. A graphical relation between the 10-year and 25-year peak discharges was developed to estimate the 25-year discharge. (Woodard-USGS)

ANT SURVIVAL IN THE ARID SOUTHWEST YEARS AFTER SEEDING,
zona State Univ., Tempe.
. Judd, and L. W. Judd.
rnal of Range Managemet, Vol. 29, No. 3, p -251, May 1976. 2 fig, 1 tab, 5 ref.

criptors: *Range management, *Arid lands, izona, *Southwestern U.S., *Desert plants, ge grasses, Shrubs, Vegetation, Soil-water-t relationships, Vegetation establishment, eat grasses.
ntifiers: *Tonto National Forest(Arizona).

8 plant species seeded in 1945 in the Tonto Na-al Forest, Arizona, 13 survived for at least 20 rs and 7 for 30 years. Original planting included pecies of grass and grass-like plants and 7 of bs. Planting sites were in semidesert shrub or sland, chaparral, or pinyon-juniper areas, sites ed as representative of forest acreage and low fall situations. Plants which survived for at t 20 years are recommended for restoring eted rangelands in the Southwest, the species l depending on the site. Two wheatgrasses, testan bluestem, three lovegrasses, and rough odora did well where planted, especially with preparation and mulching. Those which sur-d a full 30 years were crested wheatgrass and ping lovegrass in the grassland, and Boer and mann lovegrassees, blue panicgrass, sand seed and menodora in the chaparral. No spe-survived in semidesert shrub or ponyn-juniper . Blue panicgrass and white tridens disap-ed some seasons but made periodic returns, ibly due to moisture relations. (Jahns-ona)

ifiers: Walnut Gulch Experimental rshed(Ariz).

ts are reported of pitting and rootplowing on ce runoff at the Walnut Gulch Experimental rshed, a desert shrub range in southeastern na, and the time-dependent changes in soil ce characteristics caused by such practices. and gravel were negatively correlated with ce runoff, but when combined (erosion pave-caused a significant runoff reduction. Ex-soil caused runoff increases, while crown caused decreases. Runoff was significantly ated with percent bare soil at the 1% level; and gravel were negatively correlated with at the 1 to 5% levels, respectively. Litter ced no significant runoff reduction. The sur-ughness of rootplowed and pitted plots pro-detention storage for average-sized storms, and conservation treatments reduced runoff compared with control conditions. Rootplow treatment had the lowest yield for 1970 and 1971, but overgrazing increased runoff in 1972. Decreased vegetative cover due to heavy grazing or after rangeland conversion caused decreased rainfall interception and contributed to soil surface sealing. (Jahns-Arizona)
W76-13130

RANGE FERTILIZATION IN THE NORTHERN GREAT PLAINS,
Agricultural Research Service, Sidney, Mont. Northern Plains Soil and Water Research Center.
J. R. Wight.
Journal of Range Management, Vol 29, No 3, p 180-185, May 1976. 2 fig, 30 ref.

Descriptors: *Range management, *Fertilization, *Great Plains, *Nitrogen, *Crop production, Forages, Grazing, Water utilization, Soil-water-plant relationships, Forage palatability.
Identifiers: *Water-use efficiency.

Summaries are presented of forage and animal responses to range fertilization in the northern Great Plains where nutrient deficiency, especially of nitrogen, is a major growth-limiting factor. With proper management, applications of 30 to 50 lb N/acre/year can increase forage production 50 to 100%, with N-use efficiency of about 20 lb dry matter/lb N applied, or in grazing situations about 1 lb/lb N. Higher rates will produce more beef but less efficiently. Range fertilization can also improve water-use efficiency and forage quality and palatability. With applications of 50 lb N/acre/year or less, species composition changes gradually and can be controlled by application timing and by season and grazing intensity. Dramatic changes in species composition usually occur when applications exceed 150 lb N/acre. Because of the close relationship between water-use efficiency and forage yields, responses in both are similar. Fertilization can also increase the amount of precipitation available for plant use because the stimulated root system extracts more water from the profile. (Jahns-Arizona)

FLUCTUATIONS OF GROUND-WATER LEVELS IN LEE COUNTY, FLORIDA, IN 1974,
Geological Survey, Tallahassee, Fla.
T. M. Missimer, and T. H. O'Donnell.
Open-file report FL-75008, 1976. 75 p, 40 fig, 7 tab, 4 ref.

Descriptors: *Observation wells, *Groundwater, *Water level fluctuations, Pumping, Groundwater recharge, Aquifers, Water table, Hydrologic data, *Florida.
Identifiers: Lee County(Fla).

Drought and high-water conditions occurred in Lee County, Fla., during the 1974 water year. In response to increased pumpage during the dry season, water levels in most observation wells tapping the water-table, sandstone, upper Hawthorn, and lower Hawthorn aquifers dipped to record-low levels. During the succeeding wet season, levels in most of the observation wells recovered to nearly normal levels. In some localities, water levels in wells tapping the sandstone aquifer have been declining over the years. Heavy pumping in west-central Lee County has resulted in a continuing decline of water levels in the upper Hawthorn aquifer. (Woodard-USGS)
W76-12801

A HYPOTHESIS OF ION FILTRATION IN A POTABLE-WATER AQUIFER SYSTEM,
Geological Survey, Austin, Tex.
W. W. Wood.
Ground Water, Vol 14, No 4, p 233-244, July-August 1976. 9 fig, 4 tab, 22 ref.

Descriptors: *Filtration, *Ions, *Ion transport, *Potable water, *Aquifer systems, Chemical reactions, Water chemistry, Geochemistry, Reverse osmosis, Sampling, Chemical analysis, Evaluation.
Identifiers: *Grand River basin(Mich), *Saginaw aquifer system.

Chemical analyses of major dissolved constituents in approximately 300 samples of ground water and 60 samples of stream water indicate that the process of ion filtration may control the distribution of some major ionic species in the water of the Saginaw aquifer system. This system, which is in the upper Grand River basin of the central part of the southern peninsula of Michigan, consists of sandstone, shale, coal, and limestone of the Saginaw Formation of Pennsylvanian age and overlying glacially deposited sand and clay of late Wisconsin age. The Saginaw Formation is recharged through the glacially deposited material; however, the concentrations of iron, calcium,

sulfate, and chloride are greater in water in the glacial deposits than in water in the underlying Saginaw Formation. It is hypothesized that shale beds in the Saginaw Formation act as ionic filters, allowing water with a lower dissolved-solids concentration to move through the shale to the sandstone aquifer. A concentration of ions greater than input value forms above the shale beds. Gravity provides the energy necessary to filter the water in a process of reverse osmosis. The similarity of this hydrogeologic system to other systems suggests that ion filtration may occur in many potable-water aquifers. (Woodard-USGS)
W76-12803

A SUMMARY OF THE GROUND-WATER HYDROLOGY OF THE AREA BETWEEN THE LAS VEGAS VALLEY AND THE AMARGOSA DESERT, NEVADA, WITH SPECIAL REFERENCE TO THE EFFECTS OF POSSIBLE NEW WITHDRAWALS OF GROUND WATER,
Geological Survey, Reston, Va.
I. J. Winograd.
Available from the National Technical Information Service, Springfield, VA 22161 as TEI 840, $5.00 in paper copy, $3.00 in microfiche. Report TEI-840, September 1963. 79 p, 2 fig, 56 ref, append.

Descriptors: *Groundwater resources, *Available water, *Water supply, *Hydrogeology, *Surveys, City planning, *Nevada, Data collections, Aquifer characteristics, Water yield, pumping, Water quality, Hydrologic budget.
Identifiers: *Nevada test site(Nev), Las Vegas Valley(Nev), Amargosa Desert(Nev).

Three general areas in the vicinity of Mercury, Nevada, are being considered by the Atomic Energy Commission for development of a town to facilitate operations at the Nevada Test Site. The hydrologic environment in which the townsite water supplies might be developed and the effects of pumping groundwater at each of several potential townsites upon other water supplies is summarized. Two extensive ground-water basins are involved in the townsite water-supply development. The Ash Meadows ground-water basin consists of several hydraulically connected valleys including Three Lakes and Indian Spring Valleys, Frenchman, Yucca, and Jackass Flats, the Amargosa Desert and Pahrump Valley. The Las Vegas ground-water basin consists primarily of the Las Vegas Valley. (Woodard-USGS)

D. M. Woller, and J. P. Gibb.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 256, $5.00 in paper copy, $3.00 in microfiche. ISWS Bulletin 60-20, 1976. 91 p, 2 fig.

Descriptors: *Water supply, *Illinois, *Groundwater resources, Unconsolidated aquifers, Well data, Gravels, Sand aquifers, Bedrock, Sandstones, Dolomite, Groundwater availability, Groundwater, Hydrology, Hydrogeology, Water sources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Deep wells, Shallow wells, Geology, Aquifers.
Identifiers: *Lake County(Ill), Dissolved minerals, Water bearing formations.

All available information on production wells used for public water supplies in Lake County, Illinois, was presented. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. The report included separate descriptions for 57 public water supply systems furnishing water to 23 municipalities, 32 subdivisions, 2 state parks, and 1 treatment plant in Lake County. These were preceded by brief summaries of the groundwater geology of the county and the development of groundwater sources for public use. Individual production wells for each supply were described in the order of their construction. The description for each well included the aquifer or aquifers tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. GROUNDWATER GEOPHYSICS IN SOUTH AFRICA,
Wellfield Services, Johannesburg (South Africa).
C. D. Mackie.
Journal of the Groundwater Association of South and South West Africa, Vol. 1, No. 3, p 7, 9-10, December, 1975. 4 fig.

Descriptors: *Geophysics, *Electrical studies, *Gravity studies, Africa, *Magnetic studies, *Seismic studies, Subsurface mapping, *Groundwater.
Identifiers: *Geophysical methods, South Africa.

The use of ground-water geophysical methods in prospecting for groundwater sources is comparatively new to South Africa. A great potential for its use exists not only in remote and arid areas, but also in the more densely populated areas where the need exists for increased supplies of potable water supplies. Several of the more basic methods now in use in South Africa are: gravity surveys, magnetic surveys, electrical resistivity surveys and seismic survey methods. These geophysical methods are suited predominatly to flat or undulating terraines where the over burden is relatively thin. The methods used in a specific situation are dictated by the physical properties of the rocks. Since some methods may be more economical than others the choice may be swayed in that respect. It is in the selection and application of the many different techniques that the role of the hydrogeophysicist becomes highly important. (Heiss-NWWA)

GROUND WATER MOVEMENT,
National Water Well Association, Worthing Ohio.
T. E. Gass.
Water Well Journal, Vol. 30, No. 9, Septem 1976. p 26-27, 1 fig.

Descriptors: *Groundwater movement, *W table, *Water yield, *Saturation, *Permeab *Aquifers, Evaporation, Transpiration, Tran sivity, Fractures, Fissures, Igneous rock, bonate rock, Sediments, Preci tion(Atmospheric).
Identifiers: Unconsolidated materials(Geolo Solution cavities.

Nearly all ground water originates as precipita As rain falls on an area, some will penetrate the ground. Of this water, some will event return to the atmosphere through evapotrans tion. The remainder will infiltrate the gr whether it consists of unconsolidated mat fractured rock, or solution cavities. Ground usually enters the aquifer within a radius miles from its point of withdrawal, exception rare. Ground water is not usually found in flo veins or underground rivers, but travels s between pores and in fractures of rocks. U non-artesian conditions, water moves down through the overlying rock. The larger, rounded, and better sorted the grain size in a the greater the permeability will be. As con tion increases with depth, the ability to tra water is retarded. When the overlying beds very low permeability, more of the water move horizontally from adjacent areas. Whe terconnected pore spaces in rocks are too sm permit significant water movement, fracture provide a route for ground water move between the surface and the water table. water table is the upper surface of the water rated underground rock strata which approxi ly parallels the overlying topography, and co the direction of ground water flow. Due to th that subsurface materials are not uniform and tures tend to occur in zones, water yield will from one locality to another. (Grober-NWW

d water in Union County, N. J., occurs in oids of unconsolidated stratified drift ts of Pleistocene age and in the joints and es of the Brunswick Formation and ng Basalt of Late Triassic age. Wells (6 or greater in diameter) in the stratified drift s yield from 180 to 690 gallons per minute Wells (6 inches or greater in diameter) in unswick Formation yield from 12 to 870 Withdrawals of ground water from all s in Union County for public supply are ed to average about 16.0 million gallons per gd) in 1968. The greatest quantity of ground s withdrawn from the Brunswick Formaout 11.6 mgd for public supply in 1968. The d drift aquifers yield substantial quantities of water--about 4.4 mgd in 1968--but the deposits are of limited extent. The Watchung Basalt is of minor importance as an aquifer in Union County. The quality of ground water from the stratified drift deposits is generally acceptable for most uses. Hardness ranges from 110 to 210 mg/liter. The pH ranges from 6.4 to 8.5. The quality of ground water from the Brunswick Formation is acceptable throughout the country for most uses. Hardness ranges from 71 to 1193 mg/liter. The pH ranges from 6.3 to 8.5. (Woodard-USGS)

GEOHYDROLOGY OF THE OKLAHOMA PANHANDLE, BEAVER, CIMARRON, AND TEXAS COUNTIES,
Geological Survey, Oklahoma City, Okla.
D. L. Hart, Jr., G. L. Hoffman, and R. L. Goemaat.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 028, $6.00 in paper copy, $3.00 in microfiche. Water-Resources Investigations 25-75, April 1976. 62 p, 15 fig, 10 plates, 6 tab, 38 ref.

Descriptors: *Hydrogeology, *Aquifer characteristics, *Irrigation, *Water quality, *Oklahoma, Water utilization, Groundwater resources, Withdrawal, Water yield, Water levels, Groundwater recharge, Groundwater availability, Chemical analysis, Maps.
Identifiers: *Oklahoma Panhandle.

The Ogallala aquifer is the principal source of ground water in the Oklahoma Panhandle. Based on an estimated average storage coefficient of 0.1, the quantity of water stored in the Ogallala aquifer was computed at approximately 50 million acre-feet. Local overdevelopment of this water resource has resulted in water-level declines of more than 40 feet from 1966 to 1972. The amount of ground water in storage has been reduced about 2 percent. Aquifer tests indicate that transmissivity ranges from 500 to 11,800 feet squared per day, the storage coefficient ranges from 0.002 to 0.11, and hydraulic conductivity ranges from 2.1 to 55 feet per day. Other aquifers that locally yield sufficient water for irrigation are the Dakota and Cheyenne Sandstone. Water levels in these aquifers have not shown the pronounced declines that have occurred in the Ogallala aquifer. Water in the Ogallala aquifer, Dakota Sandstone, and Cheyenne Sandstone Member generally has a dissolved-solids concentrations of less than 500 mg/liter. The dissolved-solids concentration in water from the Permian red beds generally exceeds 500 mg/liter and locally exceeds 2,000 mg/liter. (Woodard-USGS)

VERTICAL TEMPERATURE AND CHEMICAL GRADIENTS IN GROUNDWATER IN THE TUCSON BASIN, ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
S. G. Mburu.
Master of Science Thesis, 1975. 93 p, 24 fig, 4 tab, 42 ref, 3 append.

Descriptors: *Groundwater, *Water temperature, *Water chemistry, *Water analysis, *Water wells, Aquifers, Water sampling, Electrical conductance, Hydrogen ion concentration, Well data, Drilling, Testing procedures, *Arizona.
Identifiers: *Tucson Basin(Ariz), Well bores.

Vertical temperature and chemical gradients studied in the groundwater of Tucson Basin indicated that temperature gradients can be used as an index of vertical mixing in well bores and thus as a guide for interpreting point samples for chemical analysis. A glass-probe termistor was used for measuring water temperature variations at different well bore depths. Techniques for plotting and analysis are described, and results given and graphed. Compared profiles of temperature, electrical conductivity, and bicarbonate and chloride contents indicated agreement with the assumed hypotheses of vertical flow and/or mixing in well bores for half of the sampled wells. Chemical gradient anomalies noted were partly due to incomplete chemical analysis; another possible cause is a general uniform chemical composition of aquifer water which does not change significantly with depth. Water chemistry was relatively uniform and had little variation with depth; pH studies revealed that water in most wells was in or close to equilibrium with respect to calcite. The water is mainly of sodium or calcium bicarbonate type in irrigation water class C2-S1. Applications of this water sampling technique are suggested. (Jahns-Arizona)

GEOTHERMAL ENERGY SYSTEM HEAT EXCHANGER AND CONTROL APPARATUS,
Sperry Rand Corp. New York. (Assignee).
K. E. Nichols.
U. S. Patent No. 3,961,866, 5 p, 5 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 690-691, June 8, 1976.

Descriptors: *Patents, *Geothermal studies, *Temperature, Thermal properties, Energy, *Energy transfer, *Heat exchangers, Injection, Injection wells, Steam turbines, Electrical power plants.

A geothermal energy transfer and utilization system extracts thermal energy stored in hot solute-bearing well water to generate super-heated steam from an injected flow of clean water; the super-heated steam is then used for driving a turbine-driven pump at the well bottom for pumping

the hot solute-bearing water at high pressure and always in liquid state to the earth's surface, where it is used by transfer of its heat content to a closed-loop vapor generator-turbine-alternator combination for the generation of electrical or other power. Cooled, clean water is regenerated by the surface-located system for re-injection into the deep well and the residual concentrated solute-bearing water is pumped back into the earth. Heat exchanger apparatus is located adjacent the turbine-driven pump for permitting steam exhausted by the turbine to cool that part of the re-injected water used as a hydraulic bearing lubricant. SELECTED EFFECTS OF SUBURBAN DEVELOPMENT ON RUNOFF IN SOUTH-COASTAL, CALIFORNIA.
Geological Survey, Menlo Park, Calif.
T. J. Durbin.
In: Proceedings of National Symposium on Urban Hydrology and Sediment Control, held at University of Kentucky, Lexington, Kentucky, July 28-31, 1975: American Society of Civil Engineers, p 209-217, 1975. 8 fig, 7 tab, 9 ref.

Descriptors: *Urban hydrology, *Urbanization, *Urban runoff, *Model studies, *Flow characteristics, Watersheds(Basins), Streamflow, Flow rates, Peak discharge, Storm runoff, Evaluation, *California.
Identifiers: *South-coastal California.

The Stanford Watershed Model was used to simulate the effects of suburban development on the runoff from five drainage basins in the south-coastal area of California, a region with a semiarid climate and an average annual precipitation of 15 inches. The drainage basins ranged in size from 3.72 to 83.4 square miles. Using the model, synthetic records of runoff for each basin were generated to represent various degrees of suburban development. Examination of the synthetic records indicated that suburban development has the following effects on runoff: (1)Average annual runoff from a drainage basin with an effective impervious area of 10 percent of the drainage area is approximately 2 inches. The average annual runoff from a fully developed basin with an effective impervious area of 30 percent is approximately 4 inches. (2)Suburban development can increase the magnitude of peak discharge with a recurrence interval of 2 years by a factor of three to six. (3)Peak discharges that have recurrence intervals greater than a limiting value ranging from 50 to 200 years or more are little affected by suburban development. (Woodard-USGS)

URBAN HYDROLOGY FOR SMALL WATERSHEDS.
Soil Conservation Service, Washington, D. C. Engineering Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-244 531, $5.00 in paper copy, $3.00 in microfiche. Report SCS/ENG/TR-55, Technical releasee No. 55, Final report. January, 1975. 40 p, 12 tab, 17 fig, 5 append.

Descriptors: *Urban runoff, *Urban hydrology, *Runoff, *Floods, *Peak discharges, Surface runoff, *Urbanization, Vegetation, *Land use, Detention, *Retention, Graphical method, Water velocity, Watershed management, Reservoirs, Cisterns, Pondage, Infiltration, Storage.
Identifiers: Tabular method, SCS-TR-20 method, *Soil-cover-complex method.

Urbanized watersheds are covered by impervious structures such as roads, sidewalks, parking lots and houses. Transition from rural to urban land uses increases runoff volume and peak discharges. 'The amount of runoff from a storm depends on detention, infiltration, evapotranspiration, etc. and is related to soil type, type of vegetation, and amount of impervious cover.' With modifications, a soil-cover-complex method can be used to estimate runoff in urban areas. Peak rate of runoff is determined by 3 watershed parameters related to the velocity water flows from point of impact to watershed outlet: time of concentration, travel time and watershed lag. Decreasing peak discharges and dangers of flood require control methods dealing with storage availability, outflow rate and inflow rate. Advantages and disadvantages of measures for reducing or delaying runoff are given for cisterns, rooftop gardens, surface pond storage, ponding on roof, roof roughness, porous pavement, grass channels, vegetated strips, reservoir or detention basin, converted septic tank for storage, ground water recharge, high-delay grass and routing flow over lawns. Tabular, graphic and the SCS-TR-20 methods of determining peak flows are discussed. (Gentry-North Carolina)

THE IMPACT OF SUBURBANIZATION ON THE STREAM CHANNEL NETWORKS OF RALSTON CREEK AND SOUTH BRANCH, IOWA,
Iowa Univ., Iowa City. Dept. of Geography.
W. L. Graf.
Institute of Urban and Regional Research, University of Iowa, Iowa City, Technical Report No. 62, October 1975. 37 p, 8 fig, 3 tab, 16 ref, append.

Descriptors: *Drainage systems, *Urbanization, Streams, *Channels, *Peak discharge, Urban drainage, Water control, Water management(Applied), Channeling, Erosion, Deposition, Stream flow, *Iowa.
Identifiers: Bifurcation ratio, Arrangement index, Energyscape.

Drainage channels change their cross-sectional shape as a result of increased runoff from impervious suburban surfaces. Stream discharge represents energy responsible for environmental change or continuity. Channel networks spatially control hydrological activity, and thus also control distribution of energy, called the energyscape. This study is concerned with how the effect of artificial channels created during suburbanization alter the character of stream networks and influence flooding, erosion and deposition problems. Twenty-three variables are used to describe the effects suburbanization has on stream networks and stream flows. Principal variables are the number and length of exterior and interior links and channels, drainage area, drainage density, bifurcation ratio and arrangement index. It was concluded that network changes have contributed to flooding and consequences on fluvial landforms are expected. Future research will attempt to determine the relationship between network parameters and hydrologic parameters, and link network characteristics to flood characteristics by regression models. Total N, total C, and readily available organic inorganic P contents, and particle-size dist tions were determined for samples of soils sediments collected from three agricul watersheds in north Mississippi. The total qu ties of N, P, C, and clay accumulated in the ments of each reservoir were calculated. T values were compared with those calculated soil losses estimated by using the Universal Loss Equation. The results showed conside variation between the percentages of nutrients and of soil particles retained in the r voirs. These reservoirs were highly effecti retaining eroded soil particles. However, the centages of soil nutrients retained in the rese sediments were less than the percentage retained soil particles. (Henley - ISWS)

ENVIRONMENTAL TRACE MATERIALS: COMPUTER COUPLED RADIOACTIVATION ANALYSIS,
Environmental Research Lab., Corvallis, Oreg.
M. H. Feldman, D. E. Cawlfield, and K. V. Byram.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 105, $4.00 in paper copy, $3.00 in microfiche. Report EPA-600/3-75-015, December 1975, 42 p, 9 tab, 5 fig, 29 ref.

Descriptors: *Radioactivity techniques, *Trace elements, Tracers, Monitoring, Analytical techniques, Sludge, Sediments, Freshwater, *Pollutant identification.

Radiation methodologies for environmental trace materials research, in particular neutron activation or the equivalent x-ray spectroscopic methods, were found to be feasible at laboratories with access to suitable irradiation sources. Neutron activation analysis is desirable for environmental tracer experiments because of its sensitivity and its use of constituent tracer nuclides rather that the introduction of other tracers. Samples used in these studies ranged from sewage treatment plant sludges and marine sediments to fresh waters containing very low concentrations of molybdenum, and ores and fertilizers containing cadmium. Gold, silver, and chromium were found to be useful elements for sludge tracing. (Chilton-ORNL)

GEOCHEMICAL CONTROLS ON LEAD CONCENTRATIONS IN STREAM WATER AND SEDIMENTS,
Geological Survey, Menlo Park, Calif.
J. D. Hem.
Geochimica et Cosmochimica Acta, Vol 40, p 599-609, 1976. 5 fig, 1 tab, 29 ref, append.

Descriptors: *Geochemistry, *Lead, *Streams, *Sediments, *Cation exchange, Mathematical models, Solubility, Heavy metals, *Path of pollutants, *Pollutant identification.

The equilibrium distribution of lead in solution and adsorbed on cation exchange sites in sediment theoretically may be calculated from equations representing selectivities of substrate for lead over H, Ca, and Na, and the stabilities of lead solute species. Such calculations include consideration of total concentrations of major ions, cation exchange capacity (CEC) of substrate, and pH, at values expected in various natural systems. Measurements of CEC and selectivity coefficients were made for synthetic halloysite, a finely divided amorphous 1:1 clay prepared by precipitation from a mixture of solutions of aluminum and silica. Where suspended sediment having the same properties is present in concentrations of 10-1,000 mg/liter at pH 6-8, more than 90% of the lead present can be adsorbed on sediment surfaces. The cation exchange behavior of lead and other minor cationic species in natural systems could be predicted by this type of model if enough other supporting information were available. Information of the type needed describing natural stream sediments, however, is presently inadequate for accurate predictions. (Woodard-USGS)

REMOTE SENSING STUDY OF MAUMEE RIVER EFFECTS ON LAKE ERIE,
National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.
R. Svehla, C. Raquet, D. Shook, J. Salzman, and T. Coney.
Report No. NASA TM X-71780, July 1975. 26 p, 9 fig, 1 tab, 2 ref, 4 append.

Descriptors: *Remote sensing, *Water quality, *Ohio, *Pollutants, *Lake Erie, Aircraft, Ships, Infrared radiation, Sampling, On-site investigations, Suspended solids, Pollution, Water pollution sources, Path of pollutants, Measurement, Instrumentation, Pollutant identification.
Identifiers: *Maumee River(Ohio).

A preliminary report of a pilot study of the effects of river inputs on boundary waters was presented. The study was done in support of Task D of the Pollution from Land Use Activities Reference Group of the International Joint Commission. Task D has the responsibility to assess the significance of river inputs into receiving waters, dispersion of pollutants, and the effects on water quality. The objective of this effort was to assess the effects of the spring runoff of the Maumee River on Lake Erie by a combination of ship survey and remote sensing techniques. Imagery obtained from a multispectral scanner of the west basin of Lake Erie was presented and discussed. The imagery clearly showed the distribution of particulate throughout the covered area. This synoptic view, in addition to its qualitative value, can be very useful in selecting sampling stations for shipboard in situ measurements, and for extrapolating these quantitative results throughout the area of interest. REVIEW AND EVALUATION OF AVAILABLE TECHNIQUES FOR DETERIMINING PERSISTENCE AND ROUTES OF DEGRADATION OF CHEMICAL SUBSTANCES IN THE ENVIROMENT,
Syracuse Univ. Research Corp., N. Y. Life Sciences Div.
P. H. Howard, J. Saxena, P. R. Durkin, and L-T-, Ou.
Available from the National Techical Information Service, Springfield, VA 22161 as PB-243 825 $13.50 in paper copy, $3.00 in microfiche. Report EPA-560/5-75,006, May, 1975. 549 p, 54 fig, 48 tab, 745 ref.

Descriptors: *Waste water treatment, *Pollutant identification, *Sewage treatment, *Biological treatment, *Activated sludge, Sewerage, Analytical techniques, Biochemical oxygen demand.
Identifiers: Degradation testing.

Techniques used to study the persistence and breakdown of chemicals in the environment are reviewed, based on information from papers, books, review articles, and abstracting and computer services. A cost analysis of the techiques was also undertaken. The quality and quantity of the information varied considerably; pesticies and detergents in water and sewage were intensively studied. A relationship between environmental persistence and chemical structure is presented, with some theoretical grounds for such correlations. An attempt was made to categorize chemicals by suitable test methods. Precise criteria for evaluating environmental stability are lacking. There are three types of degradation: biodegradation, photochemical degradation, and chemical degradation. In contrast to the others, biodegradation generally yields completely mineralized end products. Biochemical oxygen demand (BOD) is frequently used for rapid screening. The river die-away test monitors the disappearance of the test chemical in natural water. Shake culture tests can use either mixed or pure cultures. Semicontinuous and miniature continuous models of activated sludge systems and models of tricking filter and anaerobic systems can measure biodegradability in sewage treatment systems. Determining biodegradation routes requires several methods, often involving cell-free extracts. Photochemical processes except in the atmosphere are poorly understood. Chemical degradation of some compounds should be studied in sterilized media. Because laboratory biodegradability studies are qualitative, they are relatively less important for metal compounds, many of whose reactions are reversible. (Snyder-FIRL)

A VIRUS-IN-WATER STUDY OF FINISHED WATER FROM SIX COMMUNITIES,
Health Effects Research Lab., Cincinnati, Ohio. Water Quality Div.
E. W. Akin, D. A. Brashear, and N. A. Clarke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 042, $4.00 in paper copy, $3.00 in microfiche. Report EPA-600/1-75-003, September, 1975. 18 p, 9 tab, 4 ref.

Descriptors: *Pollutant identification, *Treatment facilities, *Analytical techniques, *Viruses, *Municipal water, Cities, Ohio, Indiana, Missouri, *Water treatment, Public health.

Six sites were chosen for a study of virus in water. They were Columbus, Ohio; Sidney, Ohio; Muncie, Indiana; Seymour, Indiana; Kansas City, Missouri, and St. Joseph, Missouri. Sites were selected on the basis of a treatment plant's use of surface source water with domestic contamination as indicated by high fecal coliform counts. An effort was also made to select sites using conventional procedures for flocculation or softening. Plants of various sizes, as indicated by output volumes, were chosen. The study was carried out to determine if the procedures and equipment presently available could detect human enteric viruses, and to test virus-sampling procedures and equipment in the field. A flow-through virus-adsorbent system was used. If viruses were pres in these waters, the numbers were below the tectable level of a sensitive viruses recov procedure. (Snyder-FIRL)

biochemical and mechanical reasons for sam-
change on intake systems were studied. Tests
e made on different types of pumping systems.
erimental data showed sample degradation
use of biological metabolism, cavitation, and
tion. Samples drawn from the river channel
usually representative of most of the water in
stream. High sample velocity through a
line of consistent cross section is required,
use sample degradation resulting from biolog-
metabolism of sludge and slime microbes
in the pipeline should be insignificant. Raw
r should flow directly from the river through a
p and to the instrumentation shelter. A posi-
pressure system with low residence time
mizes mechanical sample change due to
tation, reaeration, and damping. A system
gned for minimal biological sample degrada-
may not require automatic cleaning. Above a
in velocity for a specific line length and ex-
d internal surface, biological degradation is
nificant. Cursory results show that an op-
m velocity is attainable that would eliminate
need for automatic cleaning. Initial design
ld be aimed toward this optimum system. Ac-
to the intake strainer should be easy, because
dic manual cleaning is required. The design
consider system maintenance. All com-
nts must be accessible from the river bank
g the most adverse stream conditions.

treatment.

haracteristics of storm and combined sewer
are briefly reviewed. These are difficult to
tely characterize in a water quality sense
the wide range of pollutants, the possible
variations within a cross-section of the
widely varying flow rates, the frequent
ce of significant bed load, and debris which
arm the sampler. The requirements for sam-
re discussed. Due to the large number of
varying parameters, a systems approach to
ing an automatic sampler is virtually manda-
he essential elements of such a system are
mpler, intake subsystem, the sample gather-
system, the sample transport subsystem,
mple storage subsystem, and the controls
wer subsystem. A new automatic sewer
g system was built using a modular ap-
, which allows the basic design implementa-
be tailored to suit various sampling and site
ments. It incorporates all solid-state elec-
, a clock for time correlation, high sample
and transport velocities, large peristaltic pumps and fluidic diverters to avoid moving parts in the sample train, the return of the first flow to waste, a fresh water purge and backflush before and after collecting each sample, multilevel sample intakes with non-intrusive mounting, and large sample capacity. The prototype performed well when field tested in a sewer. It was also tested with synthetic sewage under laboratory conditions and found capable of gathering reasonably representative samples over a range of flow characteristics. Four commercial samplers were tested side by side with the prototype under laboratory conditions and their results ranged from an overall understatement of pollutant loading by 25% to overstatements of 200%. ISOLATING ORGANIC WATER POLLUTANTS: XAD RESINS URETHANE FOAMS, SOLVENT EXTRACTION,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
R. G. Webb.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 647, $4.00 in paper copy, $3.00 in microfiche. Report EPA-660/4-75-003, June, 1975. 21 p, 2 fig, 2 tab, 12 ref.

Descriptors: *Pollutant identification, *Analytical techniques, *Separation techniques, *Solvent extractions, *Resins, Adsorption, Chromatography, Drying, Gas chromatography, Organic wastes, Oily water, Pulp wastes, Dyes, *Isolation.
Identifiers: Kuderna-Danish evaporator.

Macroreticular resins (XAS-resins) and urethane foams were investigated as adsorbents for the isolation of organic pollutants from water. The procedures and reagents for solvent extraction were also examined for inefficiencies. XAD-2, 4, 7, and 8 and various mixtures effectively extracted a broad range of individual industrial pollutants and mixtures typical of paper mill waste waters, dissolved fuel oil, and textile dyes. Typical resin recovery efficiencies were 65 to 75% for individual compounds; direct chloroform extraction efficiency was 80%. These resins may be useful in long term or composite sampling. Polyurethane foams were not effective in extracting many compounds found in industrial effluents, although they function well for PCB's. Either chloroform or methylene chloride is generally recommended over diethyl ether or hexane as an extraction solvent. Drying of chloroform extracts before evaporation was shown to be unnecessary; drying with sodium sulfate or glass wool resulted in lower recoveries than direct concentration without drying. For typical industrial effluents, extract concentration to 10 ml with a Kuderna-Danish evaporator and to as low as 0.3 ml with a micro-Snyder column resulted in greater recovery of dissolved organics than did rotating evaporators and airstream-waterbath methods. Extraction with tetralin sometimes allows nonpolar low-boiling pollutants to be detected that are usually obscured in gas chromatographic analysis by the solvent peak. (Snyder-FIRL)

MEASUREMENT AND PERSISTENCE OF CHLORINE RESIDUALS IN NATURAL WATERS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
CONF- 751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 43-71, 5 tab, 8 fig, 25 ref. DADA 17-72-C-2053.

Descriptors: *Water pollution treatment, *Waste water treatment, Water chemistry, Analytical techniques, *Chlorine, *Measurement, *Disinfection, Oxidation, *Pollutant identification, *Chlorination.

The distinction is made between good disinfectant compounds and those compounds of chlorine which are poorer as disinfectants. Hypochlorous acid is identified as a good disinfectant. Chlorine residual is identified as the concentration of all oxidizing agents produced by chlorination and remaining sometime afterward whether these oxidizing agents contain chlorine or not. The nature and persistence of chlorination products classed as chlorine residuals are discussed by type of compound. Present field, laboratory and continuous methods for determining free and combined chlorine residual are compared for specificity, reagent stability, accuracy and simplicity. A new analytical method specific for HOCl or NH2Cl in the presence of the poor disinfectants, hypochlorite, organic chloramines and other interferences is presented. CHLORINATION OF ORGANICS IN COOLING WATERS AND PROCESS EFFLUENTS,
Oak Ridge National Lab., Tenn.
R. L. Jolley, G. Jones, W. W. Pitt, and J. E. Thompson.
In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, October 22-24, 1975, Oak Ridge, Tennessee, Oak Ridge National Laboratory, p 115-152. 9 fig, 6 tab, 69 ref.

Descriptors: *Waste water treatment, *Pollutant identification, *Sewage treatment, *Analytical techniques, *Treatment facilities, Chlorination, Organic compounds, Cooling water, Effluents.

Available information concerning organic constituents in natural waters, including effluents from sewage treatment plants, is reviewed. Selected aspects of aqueous chlorination are discussed. Previous chlorination studies with sewage effluents and cooling water are summarized, and results from a recent study with a sample of cooling water are presented. Many water-soluble chlorine-containing organic compounds of low volatility were found in samples of chlorinated cooling waters from electric power-generating plants and chlorinated effluents from domestic sanitary sewage treatment plants. Both types of samples were chlorinated to milligram-per-liter chlorine concentrations in the laboratory under conditions similar to those used for treating cooling waters and disinfecting sewage effluents. High-pressure liquid chromatography was used to separate the chlorinated constituents from concentrates of the water samples. Chlorination yields (as Cl) of the chloro-organic compounds ranged from 0.5 to 3.1% of the chlorine dosage. The formation of chloro-organics and the reaction yields correlated with the chemical compositions of the samples. Several chloro-organics were quantified at the microgram-per-liter level in the domestic sewage effluents. A high degree of correspondence with respect to the elution positions of the separated constituents was revealed by comparison of the chromatograms of the chlorinated constituents in the cooling water samples with those of the sewage process effluent samples. ANALYSIS OF NEW CHLORINATED ORGANIC COMPOUNDS FORMED BY

CHLORINATION OF MUNICIPAL WASTEWATER,
North Texas State Univ., Denton. Inst. of Applied Sciences.
W. H. Glaze, J. E. Henderson IV, and G. Smith.
In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, October 22-24, 1975, Oak Ridge, Tennessee, Oak Ridge National Laboratory, p 153-175. 9 fig, 4 tab, 14 ref.

Descriptors: *Waste water treatment, *Pollutant identification, *Analytical techniques, *Organic compounds, *Chlorination, Waste water(Pollution), Municipal wastes, Chlorine, Texas, Spectrometry.
Identifiers: Chlorinated organic compounds.

Recent data on the formation of new chlorinated organics, particularly with the use of large doses of chlorine (1000 to 4000 mg/liter) are described. Two analytical techniques were used to investigate the effect of chlorination on secondary municipal waste water effluents. Total organic-bound chlorine (TOCl) is measured before and after chlorination by a microcoulometric procedure, whose development is reported. Extracts of the effluent before and after chlorination at various dosages are pyrolized and titrated in the Dohrmann halide analyzer. The TOCl results show a significant increase in the level of organic-bound chlorine in municipal waste water after chlorination, particularly using large doses of chlorine (2000 to 4000 ppm). The concentrates obtained by XAD-2 resin extractions of the effluents were studied by gas chromatography/mass spectrometry. The results confirm that chlorination causes the formation of many new chlorinated organics; the structures of over 50 have been identified. Although most of the compounds are aromatic halides, many are not derivatives of 'activated' aromatics but are simple derivatives such as chlorobenzenes, -toluenes, and -alkylbenzenes. Nonaromatic chlorides were also identified. The TOCl and GC/MS results indicate that doses of chlorine in the range of 2000 to 4000 ppm cause a very large increase in organic-chlorine content. GC/MS data on XAD extracts of Denton, Texas, drinking water are also reported. The occurrence of three iodine containing compounds, dichloroiodomethane, dibromoidomethane, and bromochloriodomethane, in the finished water is of particular interest. CHEMISTRY OF HALOGENS IN SEAWATER,
Rosentiel School of Marine and Atmospheric Science, Miami, Fla.
J. H. Carpenter, and D. L. Macalady.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 177-193, 2 fig, 18 ref. EPA R 803893-01.

Descriptors: *Sea water, *Chlorination, Analytical techniques, Bromides, *Halogens, *Chlorine, Water chemistry, *Pollutant identification.

The limited information available for reactions that occur when chlorine is added to seawater is discussed. Data shows that the widely used procedure for estimating residual chlorine of seawater samples is misleading and that the identification of the chemical species formed is a prerequisite to designing proper analytical methods. Present information suggests that the bromide ion is oxidized and disproportionates to several oxidation states. Formation of brominated or mixed brominated-chlorinated organic compounds can be expected but the extent and speciation of such reactions remain to be determined. (See also W76-12876) (Chilton-ORNL)
W76-12884

CHLORINATED COMPOUNDS FOUND IN WASTE-TREATMENT EFFLUENTS AND THEIR CAPACITY TO BIOACCUMULATE,
Minnesota Univ., Duluth. Dept. of Chemistry.
H. L. Kopperman, D. W. Kuehl, and G. E. Glass.
In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, October 22-24, 1975, Oak Ridge, Tennessee, Oak Ridge National Laboratory, p 327-345. 4 fig, 7 tab, 21 ref.

Descriptors: *Waste water treatment, *Pollutant identification, *Sewage treatment, *Analytical techniques, Sewage effluents, Disinfection, Minnows, Absorption, *Chlorination.
Identifiers: Chlorinated compounds, *Bioaccumulation.

To assess possible long-term environmental effects due to the formation of stable reaction products during disinfection processes, fathead minnows and water from the 9 month chronic toxicity tests at two waste water treatment plants were analyzed for chemical residues. Gel permeation chromatography was used for sample cleanup and gas chromatography/mass spectrometry for sample analysis. Di- and trichlorophenols, di- and trichlorobenzenes, and trichloroanisoles were detected at lower levels, if at all, in the fish from nondisinfected effluent exposures as compared to fish exposed to chlorinated effluent. All fish raised in the sewage effluent contained tetra- and pentachlorophenols, PCB's, DDT's, toxaphene components, chlordane, and nonachlor. Tribomoanisole was tentatively identified in fish that lived in waste water treated with bromine chloride. The incorporation of chlorine into compounds when it is used to disinfect effluents is an undesirable end result of effluent treatment in that compounds become more persistent and bioaccumulate to a greater extent. Identifiers: *Asbestos fibers, Chrysotile fi Amphibole fibers, Selected area electron dif tion, Energy dispersive spectrometer, Vacuu tration.

A method of measuring the concentratio asbestos fibers in filterable liquids and matrices is presented. In the described me fiber identification is based on the almost s taneous determination of the morphology, ele tal composition and crystal structure. This i complished by using a transmission ele microscope (TEM) equipped with selected electron diffraction (SAED) and an energy di sive spectrometer (EDS). Sample preparatio strumentation and procedure are discussed. V samples underwent vacuum filtration. Ex ments were conducted to determine how fiber was lost during sample preparation. mean loss of amphibole fiber for eight diff tests was 45% and the mean loss for chry fiber after eleven different tests was Chrysotile is less prone to wash off than phibole. Results showed that 40 to 100% c chrysotile fibers in water samples have distin tubular morphology. Identifiable SAED pa were observed for about 30% of the chry fibers and 60% of the amphibole fibers. By a ing corrections for SAED ambiguities and l during sample preparation and by makin lowances for the dependence of fiber compo on fiber size, it was possible to measure asb fiber concentrations with a precision of pl minus 30%. A classification scheme developed to establish maximum and min limits of fiber concentration for each sa (Pinto-FIRL)

AIRBORNE COLIPHAGES FROM WASTE-WATER TREATMENT FACILITIES,
Michigan Univ., Ann Arbor. School of Public Health.
K. F. Fannin, J. C. Spendlove, K. W. Cochran, and J. J. Gannon.
Applied and Environmental Microbiology, Vol. 31, No. 5, p 705-710, May, 1976. 6 tab, 30 ref.

Descriptors: *Air pollution, *Viruses, *Waste water treatment, *Treatment facilities, Activated sludge, Trickling filters, Coliforms, Aerosols, Bacteria, Microorganisms, Analytical techniques, Pollutant identification.
Identifiers: *Coliphages(Air borne).

Waste water treatment plant emissions of airborne coliphages that form plaques on two strains of Escherichia coli were investigated. Two activated sludge and two trickling filter plants were investigated using large volume air samplers with recirculation devices. Coliphages were enumerated by a most probable number procedure. Average coliphage levels in the airborne emissions of trickling filter beds and activated sludge units were 0.284 and 0.302/cu m, respectively; sewage liquor concentrations from the above sources were 448,000 and 2.94 million plaque-forming units/liter, respectively, depending on the Escherichia coli host used for the assay. The isolation of low levels of coliphages from the airborne emissions of waste water treatment plants demonstrates that these viruses can survive natural aerosolization and may be recovered with the procedures used. ULTRASONIC REMOVAL OF EPILITHIC ALGAE IN A BARCLAMP SAMPLER,
Ichthyological Associates, Inc., Berwick Pa.
W. F. Gale.
Journal of Phycology, Vol. 11, No. 4, p. 472-473, 1975. 1 fig., 1 tab., 1 ref.

Descriptors: *Periphyton, *Algae, *Sampling, *Rocks, *Bottom sampling, Methodology, Design, Automation, Non-destructive tests, *Ultrasonics, Standing crops, Pollutant identification.
Identifiers: Bar-clamp sampler, *Epilithic algae, Ultrasonic algae collection.

Standing crop estimates of epilithic algae are difficult to determine because it is not possible to collect quantitative samples of natural substrates in lakes and deep rivers. A bar-clamp sampler with an attached collecting cup is described which permits quantitative sampling of epilithic algae on stones 4-50 cm in diameter or larger or on artificial substrates in shallow or deep water. It is designed for SCUBA divers to use in turbid rivers too deep and swift for wading, but can be used in othe habitats. It delimits the sampling area and encloses it, so algal cells cannot enter or be lost when handling or transporting stones and holds water in the sampling area, which prevent drying, helps dislodge materials during cleaning, and carries dislodged cells to collection jars. Ultrasonic vibration remove cells from stones (up to 62% of the total) missed by scraping and brushing. The method has been used for a year to remove algae from stones collected in the Susquehanna River. It has held up well in the field, is easy for a diver wearing thick neoprene mittens to manipulate, and facilitates cleaning by stabilizing the stone and rigidly maintaining the sampling area. Its design, construction, and application are described. (Buchanan-Davidson--Wisconsin).

For several years KIWA (Testing and Research Institute of the Netherlands Waterworks) has investigated the pollution of the river Rhine and river Maas for specific organic groups. A quantity of 20 1 of water was extracted weekly with hexane, and the extract divided into several groups. The extracts were analyzed by gas chromatography and mass-spectrometry. The results of these investigations during 1974 were summarized and showed that the river Rhine is heavily polluted by oil, a number of aromatics and aromatic bases, and a number of oxygenated substances. It was also shown that the river Maas, however, is much less polluted by these substances with the exception of oil. (Henley-ISWS)

ATMOSPHERIC AEROSOLS: A LITERATURE SUMMARY OF THEIR PHYSICAL CHARACTERISTICS AND CHEMICAL COMPOSITION,
Old Dominion Univ., Norfolk, Va. School of Sciences.
F. S. Harris, Jr.
Report NASA CR-2626, January 1976. 43 p, 1 tab, 199 ref. NGR 47-003-068.

Descriptors: *Bibliographies, *Air pollution, *Aerosols, *Pollutants, *Atmosphere, Pollutant identification, Analytical techniques, Physical properties, Particle size, Spatial distribution, Temporal distribution, Salts, Organic compounds, Elements(Chemical), Saline water intrusion.

This report contained a summary of 199 recent (1968-1975) references on the characterization of atmospheric aerosols with respect to their composition, sources, size distribution, and time changes, and with particular reference to the chemical elements measured by modern techniques, especially activation analysis. The literature review was made as a guide to the characterization of aerosols which would be useful in air quality measurements by NASA-LaRC and Old Dominion University in cooperation with Region VI, Virginia State Air Pollution Control Board. The purpose of the joint measurements is to learn what types of variables it would be useful to determine in addition to the usual mass loading and meteorological factors. This examination of recent literature, particularly with respect to the results of elemental analysis and other variables of interest, may be of use to others working in this field. For the varied experimental conditions and techniques employed, reference must be made to the original articles. No attempt was made to explain differences which resulted from different conditions and techniques. (Humphreys-ISWS)

SAMPLERS FOR MONITORING RUNOFF WATERS,
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
H. L. Manges, and C. C. Nixon.
Presented at the 1975 Winter Meeting of the American Society of the Agricultural Engineers, December 15-18, 1975, Chicago, Illinois. 10 p, 4 fig, 9 ref. ASAE Paper 75-2562.

Descriptors: *Runoff, *Sampling, *Water sampling, Water pollution sources, Water pollution control, *Pollutant identification, *Monitoring.

A sampler is badly needed for collecting a proportional sample of runoff water for laboratory analysis. Pollutant load in runoff would be calculated from sample volume and pollutant concentration measurements. A sampler was designed and built which divided flow with short tubes. In laboratory tests, sampling ratio became constant after decreasing with increasing flow rates for unsubmerged flow and was constant for submerged flow. Sampling ratio was quite variable during field testing because of debris clogging the reservoir below the short tubes. A sampler using orifices surrounded by short tubes in place of the short tubes alone for dividing flow had a slightly better sampling ratio for unsubmerged flow and a constant sampling ratio for submerged flow. PREIMPOUNDMENT WATER QUALITY OF RAYSTOWN BRANCH JUNIATA RIVER AND SIX TRIBUTARY STREAMS, SOUTH-CENTRAL PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
D. R. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A027 387, $4.00 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-57, June 1976. 23 p, 5 fig, 5 tab, 5 ref.

Descriptors: *Water quality, *Baseline studies, *Pre-impoundment, *Streams, *Reservoirs, Sampling, Data collections, Chemical analysis, Water analysis, Soil analysis, Physical properties, Nutrients, Coliforms, Evaluation, *Pennsylvania, Pollutant identification.
Identifiers: *Juniata River watershed(Penn), Raystown Branch(Penn).

The Raystown Branch Juniata River watershed, which is the main water source for Raystown Lake, is a 960-square-mile drainage basin in south-central Pennsylvania. Preimpoundment water-quality data were collected on the Raystown Branch and six tributary streams in the basin. Specific conductance values varied inversely with water discharge. The pH values were extremely low only at the Shoup Run site. Dissolved oxygen concentrations observed at all sites indicated a relatively high oxygen saturation level throughout the year. Seasonal variations in nitrate-N and orthophosphate-P levels were measured at the main inflow station, Saxton, Pa. The highest concentrations of nitrate-N and orthophosphate-P occurred in the winter and spring months and the lowest concentrations were measured during the summer and fall. Bacteriological data indicated no excessive amounts of fecal matter present at the inflows. Soil samples collected at four sites in the impoundment area were predominantly of the Barbour, Philo, and Basher series, which are considered to be highly fertile soils with silt-loam and sandy-loam textures. Morphological features of the lake basin and low nutrient levels at the inflows should prevent excessive weed growth around the lake perimeter. (Woodard-USGS)

OCCURRENCE OF ARSENIC IN THE DRY CREEK BASIN, SONOMA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
R. F. Middelburg.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-028 020, $3.50 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-30, May 1976. 17 p, 5 fig, 2 tab, 13 ref.

Descriptors: *Water pollution sources, *Arsenic compounds, *Water quality, *Pre-impoundment, *Baseline studies, *California, Lakes, Springs, Hot springs, Watershed management, Water chemistry, *Pollutant identification.
Identifiers: Sonoma County(Calif), *Dry Creek basin, *Arsenic.

An arsenic reconnaissance study was made from August through November 1974 in the Dry Creek basin in northern California where the U.S. Army Corps of Engineers proposes to construct Warm Springs Dam. The purpose was to determine the extent of any potential arsenic problems that may affect Lake Sonoma which would form behind the dam. Samples of sediment, water, and biota were collected and analyzed for arsenic content. Results indicate that arsenic presents a potential problem only in the Little Warm Springs Creek area where samples of geothermal water contained 140 micrograms of arsenic per liter of water. However, the contribution of arsenic to the lake will be minimal because discharge of the geothermal water in the area is estimated to be only about 0.01 cubic foot per second (0.0003 cubic meter per second). Analyses of limited numbers of biota samples indicated that there is no biomagnification of arsenic through the food chain. Concentrations of arsenic in biota were similar both in samples collected from water containing high levels of arsenic and those collected from water with low arsenic content. (Woodard-USGS)

Identifiers: *Epifauna, *Port Valdez(Alaska).

Epifaunal organisms are abundant in estuaries a coastal waters. Because most epifaunal organis are immobile and adapted to specific condition but restricted in their distribution by physical e vironmental conditions, they can be used to dete changes in water quality. A biological sampli program at Jackson Point (proposed oil termi site) in Port Valdez, Alaska, was begun December 1970. Sixteen artificial substrate sa plers (8 multiplate and 8 rock-filled baskets w net liners) were retrieved after 2 to 4 months' e posure. The two sampler types collected appro mately the same major groups of organisms; ho ever, the multiplate samplers collected an avera of 1.6 times more organisms than the basket sa plers. The basket sampler, on the other hand, c lected three more species per sample than those the multiplate samplers. Diversity values w lower during 1972, except for the spring samp Seasonal diversity varied from a low of 0.36 in t summer of 1972 to a high of 3.99 in the fall of 19 (Woodard-USGS)

SIMPLIFIED METHOD FOR THE BIOLOGIAL ASSESSMENT OF THE QUALITY OF RESH AND SLIGHTLY BRACKISH WATER,
N. Dresscher, and H. van der Mark.
ydrobiologia, Vol. 48, No. 3, p. 199-201, 1976. 1 g., 1 tab., 7 ref.

escriptors: *Biological communities, *Analytical chniques, *Biochemical oxygen demand, rackish water, Freshwater, Decomposing ornic matter, Trophic level, *Pollutant identificaon.
entifiers: *Saprobic index.

simple method is described to biologically ass saprobic water quality a measure of the phase which the conversion process of biologically composable substances takes place. The saproc degree may be determined by examining the oportion between number of species of single oups of microorganisms; that is, the extent of llution may manifest itself biologically in nuerical proportion between heterotrophic, mixrophic, and autotrophic organism found at any ven moment. The four indicator groups chosen : A--Ciliate indicating polysaprobity, B--glenophyta indicating alpha-mesosaprobity, C--lorococcales plus Diatomeae indicating betasosaprobity, and D--Peridineae plus rysophyceae plus Conjugatae indicating gosaprobity. Ciliata species must be counted imdiately in unfixed samples. The others are clasied into groups and counted on fixed material der microscopes. A formula is devised to give saprobic quotient. This method does not quire accurate species determinations. Saprobic otients are compared with the degree of pollun and saprobic phases. This method cannot be ed when there is an abundance of a single spes which eliminates other species. (Buchanan-vidson--Wisconsin)

ALITATIVE AND QUANTITATIVE SALONELLA INVESTIGATIONS AND THEIR HYENIC VALUATION IN CONNECTION WITH COLI TITRE, DEMONSTRATED WITH EXIPLES FROM THE COASTAL WATERS OF EL BIGHT (WESTERN BALTIC SEA), (IN RMAN),
l Univ. (West Germany). Hygiene Institut.
Gaertner, G. Havemeister, B. Waldvogel, and H. Wuthe.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. 160(3), p 246-267, 1975.

Descriptors: *E. coli, Bacteria, Coliforms, Microorganisms, *Oceans, *Salmonella, Water pollution sources, Coasts, Testing, Sampling, *Water analysis, Human diseases, Diseases, Enteric bacteria, Sewage, Wastes.
Identifiers: *Baltic Sea, Escherichia-Coli, *Kiel Bight.

Qualitative salmonella investigations and E. coli titer determinations were carried out in about 4000 water samples from the coastal region of Kiel Bight in 1972 and 1973 and evaluated in connection with epidemiological data. About 100 samples were determined quantitatively by the MPN (most probable number) method and set in relation to the E. coli titer. The significance of positive salmonella findings in relation to the assessment of infection risk and as impurity indicators was investigated. With increasing E. coli contamination the proportion of positive salmonella findings increased (parabolic curve). Salmonella frequencies and the frequency with which the limiting values of the E. coli titer is exceeded run approximately parallel; the frequency of exceeding a limiting value of E. coli titer of 1.0 and the frequency of salmonella (determination in 100 ml) in sewage laden areas largely coincide. The quantitative salmonella investigations (MPN method) showed that up to an E. coli titer of 1.0, extremely low salmonella counts only are found (average 2/100 ml). With an E. coli titer of 0.1 a marked increase is seen. A limiting value of 1.0 is proposed for the E. coli titer in coastal waters. Epidemiological data show that an increased risk of (human) infection cannot be deduced from positive salmonella findings. The value of the information obtained from salmonella findings is small compared with the E. coli titer. Tests for salmonella should be dispensed with in routine water analysis.--Copyright 1976, Biological Abstracts, Inc.

METHOD AND DEVICE FOR ASCERTAINING SMALL AMOUNTS OF OIL IN WATER,
Salen and Wicander A.B., Sundbyberg (Sweden). (Assignee).
B. H. Stenstrom.
U. S. Patent No. 3,964,295, 4 p, 8 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 4, p 1495, June 22, 1976.

Descriptors: *Patents, *Oil pollution, *Oily water, Water pollution sources, *Monitoring, Oil wastes, Pollution abatement, Separation techniques, Equipment, *Pollutant identification.

A method and a device determines the oil content of small amounts of oil in water. The invention is intended to be utilized on board ships, in industries, etc., where large amounts of water are pumped out and where surveillance of the possible presence of oil is necessary and frequently regulated by legislation. A defined amount of water is removed so as to concentrate or enrich the oil and then the oil content is measured. The oil is concentrated by making a predetermined amount of oily water per unit of time pass a determined area of a filter material which absorbs or separates oil. The oil content can be measured photo-electrically by determination of the color change of the oil-absorbing filter material. (Sinha-OEIS)

OPTIMAL ESTIMATION OF DO, BOD, AND STREAM PARAMETERS USING A DYNAMIC DISCRETE TIME MODEL,
Purdue Univ., Lafayette, Ind. School of Electrical Engineering.
A. J. Koivo, and G. Philips.
Water Resources Research, Vol. 12, No. 4, p 705-711, August 1976. 9 fig, 10 ref.

Descriptors: *Water quality control, *Dissolved oxygen, *Biochemical oxygen demand, *Optimization, *Estimating, *Simulaion analysis, *Equations, Computers, Water pollution, Streams, Measurement, Filters, Mathematical models, Systems analysis, *Pollutant identification.
Identifiers: *Streeter-Phelps equation.

A modified Streeter-Phelps equation is used as the starting equation to obtain a discrete time mathematical representation for the biological oxygen demand and the dissolved oxygen concentration at discrete spatial locations in polluted stream. It represents an accurate discretization of the original model. The unknown parameters to be estimated are treated as state variables in order to compute their numerical values from noise-corrupted measurements. An optimal estimator is constructed for the estimation of the unknown parameters. Such a model is well-suited to computer applications, such as optimal estimation and control of pollution variables. By using the resulting discrete model, an optimal estimator is constructed to determine DO, BOD, maximum rate of photosynthetic production, and other pollution variables. These optimal estimates minimize the expected value of the sum of the squared estimation errors, given the past and the current measurements. They can be computed by constructing a Kalman filter for the process. A numerical example is presented to illustrate the applicability of the method. (Bell-Cornell)

SPECTRAL REFLECTANCE AND RADIANCE CHARACTERISTICS OF WATER POLLUTANTS,
Environmental Research Inst., of Michigan, Ann Arbor. Infrared and Optics Div.
C. T. Wezernak, R. E. Turner, and D. R. Lyzenga.
Report No. NASA CR-2665, April 1976. 230 p, 25 fig, 160 tab, 58 ref. NASA NAS1-13589.

Descriptors: *Remote sensing, *Water pollution, *Reflectance, Optical properties, Physical properties, Pollutants, Turbidity, Suspended solids, Oil spills, Effluents, Sewage effluents, Industrial wastes, Limnology, Oceanography, Publications, *Pollutant identification.
Identifiers: *Radiance, Visibility.

Spectral reflectance characteristics of water pollutants and water bodies were compiled using the existing literature. Radiance calculations were performed at satellite altitude for selected illumination angles and atmospheric conditions. The work described in this report was limited to the reflective portion of the spectrum between 0.40 micrometer to 1.0 micrometer. Information was included for the following general categories: (1) water bodies, (2) phytoplankton-chlorophyll, (3) suspended solids, (4) oil, (5) municipal effluent, and (6) industrial effluents. The amount of suitable material in the professional literature was found to be very limited. (Sims-ISWS)

THE FEASIBILITY OF OIL-POLLUTION DETECTION AND MONITORING FROM SPACE: EXAMPLES USING ERTS-1 AND SKYLAB DATA,
Environmental Research Inst., of Michigan, Ann Arbor. Infrared and Optics Div.
G. C. Goldman, and R. Horvath.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A017098, $4.50 in paper copy, $3.00 in microfiche. Report No. CG-D-117-75, August 1975. 59 p, 13 fig, 8 tab, 14 ref, 1 append. DOT-CG-24, 063-A.

Descriptors: *Remote sensing, *Oil spills, *Oil pollution, Satellites(Artificial), Oceans, Estuaries, Water pollution, Radiation, Monitoring, Pollutants, Data processing, Analytical techniques, *Pollutant identification.
Identifiers: *ERTS, *Skylab.

The purpose of this study was to demonstrate the feasibility of using satellite data as a means of monitoring and detecting oil spills on oceanic and estuarian waters. Four spills, or suspected spills were investigated using photointerpretation and digital-computer techniques on ERTS-1 and SKYLAB data. The results of these investigations indicated that any of these methods might be usable if the spill is large enough to be seen by satellite, if the spill occurs more than a few kilometers off shore, and if the sky and water are relatively clear. In a case in the Atlantic Ocean, the spill was easily seen, but identification of the material was not possible. In the other three cases, the presence of the spills could not be verified at all by computer techniques. ERTS-1 and SKYLAB were not considered operationally appropriate for this type of work because of the former's 18-day overpass frequency, few spectral channels, extended bandwidths, and long information-retrieval time. The latter was considered inappropriate due to its poor data quality, long information-retrieval time, lack of data for all channels, and failure to recover the same area. Monitoring and detecting oil spills could, however, involrected. (Sims-ISWS)

CONCENTRATIONS OF MERCURY, CADMIUM, LEAD AND COPPER IN THE SURROUNDING SEAWATER AND IN SEAWEEDS, UNDARIA PINNATIFIDA AND SARGASSUM FULVELLUM, FROM SUYEONG BAY IN PUSAN, (IN KOREAN),
Pusan Fisheries Coll. (Republic of Korea).
C. Y. Kim, and J. H. Won.
Bull Korean Fish Soc. 7(3), p 169-178, 1974.

Descriptors: *Mercury, *Cadmium, *Copper, *Lead, Bays, *Sea water, Asia, Heavy metals, Pollutant identification, Water pollution sources.
Identifiers: Sargassum-fulvellum, *Seaweeds, Undaria-pinnatifida, *Suyeong Bay(So Korea).

Concentrations of Hg, Cd, Pb and Cu were determined in seawater and seaweeds (U. pinnatifida and S. fulvellum) from Suyeong Bay in Pusan, South Korea, during the spring and neap tides from Jan.-April 1974. The range and mean, respectively, of the heavy metal concentrations in the seawater were: Hg, 0.00-0.39 ppb and 0.16 ppb; Cd, 0.00-0.46 ppb and 0.18 ppb; Pb, 0.00-0.94 ppb and 0.26 ppb; Cu, 0.00-0.86 ppb and 0.25 ppb. The concentrations varied slightly according to the tide. The concentration of Hg, Cd and Pb in U. pinnatifida was almost twice as much as that in S. fulvellum; the concentration of Cu in the former was slightly less than that in the latter.--Copyright 1975, Biological Abstracts, Inc.

FACTORS CONTROLLING RATES OF METHANE OXIDATION AND THE DISTRIBUTION OF THE METHANE OXIDIZERS IN A SMALL STRATIFIED LAKE,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
J. W. M. Rudd, and R. D. Hamilton.
Archives of Hydrobiology, Vol. 75, No. 4, July 1975, p 522-538, 10 fig, 18 ref.

Descriptors: *Water pollution sources, *Methane bacteria, Methane, Oxidation, Bacteria, Thermal stratification, Epilimnion, Hypolimnion, Lakes.

Several factors influenced whole lake rates of methane oxidation. Thermal stratification controlled mixing of waters containing methane and oxygen. 95% of the methane oxidation occurred during spring and fall turnover. High oxygen concentrations reduced oxidation rates in the upper part of the water column while rapid rates occurred at oxygen concentrations of less than 1.0 mg/1. During summer stratification high oxygen concentration prevented epilimnetic methane oxidation while anoxia prevented hypolimnetic oxidation. Methane concentration was a control factor only at oxygen concentrations of less than 1.0 mg/1 in a narrow lens of activity which occurred in the metalimnion during summer stratification. The bacteria responsible for methane oxidation in this lake appear to be a new strain characterized as being psychrophilic microaerophiles. (Chilton-ORNL)

MEASUREMENTS OF PHYSICAL PHENOMENA RELATED TO POWER PLANT WASTE HEAT DISCHARGES: LAKE MICHIGAN, 1973 AND 1974,
Argonne National Lab., Ill.
J. V. Tokar, S. M. Zivi, A. A. Frigo, L. S. Van Loon, and D. E. Frye.
Available from the National Technical Information Service, Springfield, VA 22161, as ANL/WR-75-1. $10.50 in paper copy, $3.00 in microfiche. Report ANL/WR-75-1, 352 p, 205 fig 27 ref, append.

Descriptors: *Water pollution sources, *Thermal pollution, Nuclear powerplants, *Lake Michigan, Great Lakes, Limnology, Physical properties, On-site investigations, Discharge(Water), *Measurement, *Path of pollutants, *Pollutant identification.

The report summarizes primary field activities of the Energy and Environmental Systems Division during 1973 and 1974 on Lake Michigan. Overall objectives of the program were to work toward a better understanding and predictive capability of the physical impacts of discharging power-plant waste heat to large temperate lakes. Field site descriptions of Point Beach Nuclear Power Plant, Zion Nuclear Power Station and Donald C. Cook Nuclear Power Plant are given. Maps are presented of areas of surface thermal plumes from single or dual discharges showing that the dual discharge situation produces far field plume areas more than double those of the single discharge situation. Measurements of vertical and horizontal eddy diffusivities and of current velocities at nearshore areas were made. Aerial infrared and boat oriented thermal plume measurement techniques were compared. (See W76-12771 thru W76-12775) (Chilton-ORNL)

THERMAL PLUME MAPPING,
Argonne National Lab., Ill.
A. A. Frigo, L. S. Van Loon, and C. Tome.
In: Measurements of Physical Phenomena Related to Power Plant Waste Heat Discharges: Lake Michigan, 1973 and 1974. p 18-163, 119 fig, 5 tab, 2 ref. W-31-109-Eng-38.

Descriptors: *Water pollution sources, *Thermal pollution, *Mapping, Isotherms, On-site investigations, Instrumentation, Nuclear powerplants, *Lake Michigan, Great Lakes, Discharge(Water). Identifiers: *Thermal plume mapping.

The plume measurement system employed submerged temperature-sensing thermistors, digitizing and recording electronics, and positioning and depth-sounding instrumentation. Comparisons were made between a limited number of dual and single plumes where salient ambient conditions were matched approximately. Dual plumes had isotherm areas about double those of single plumes where the two jets of the dual discharge had not interacted and behaved as isolated jets. The plume behavior in this regime was weakly dependent on ambient conditions. In some comparisons, farfield isotherm areas were more than double for dual discharge plumes. In all cases, areas of intermediate field isotherms were about the same for dual and single discharges. (See also W76-12770) (Chilton-ORNL)

MEASUREMENTS OF EDDY DIFFUSIVITIES IN NEARSHORE REGIONS OF LAKE MICHIGAN,
Argonne National Lab., Ill.
S. M. Zivi, D. E. Frye, R. E. Buell, and L. S. Van Loon.
In: Measurements of Physical Phenomena Related to Power Plant Waste Heat Discharges: Lake Michigan, 1973 and 1974. p 164-210, 21 fig, 4 tab, 15 ref. W-31-109-Eng-38.

Descriptors: *Thermal pollution, *Diffusivity, *Eddies, Discharge(Water), *Measurement, *Lake Michigan, Instrumentation, *Path of pollutants, *Diffusion.

Measurements of vertical and horizontal eddy diffusivities produced values consistent with open lake values reported in the literature when correlated as a function of a characteristic length scale. Horizontal diffusivities were found to be unperturbed by plume stratification and interfaces within the far field. Vertical diffusivities within the plumes and in the far field were several orders of magnitude smaller than the horizontal values. The measurements provide a range of values for use in theoretical models of thermal plume dispersal where eddy diffusivity is a required input parameter. Refinement of photodensimetric methods and bottle sampling techniques were important steps in developing a field technique and methodology for more rapidly measuring eddy diffusivities. A COMPARISON OF AERIAL INFRARED AND BOAT ORIENTED THERMAL PLUME MEASUREMENT TECHNIQUES,
Argonne National Lab., Ill.
R. P. Madding, G. J. Marmer, and J. V. Tokar.
In: Measurements of Physical Phenomena Related to Power Plant Waste Heat Discharges: Lake Michigan, 1973 and 1974. p 211-245, 3 tab, 18 fig, 3 ref. W-31-109-Eng-38.

Descriptors: *Thermal pollution, *Measurement, *Instrumentation, Thermometers, Remte sensing, On-site investigations, Nuclear powerplants, Discharge(Water), *Lake Michigan, Great Lakes, Infrared radiation.

Near simultaneous thermal plume mapping using the University of Wisconsin's remote aerial infrared scanning system and ANL's in situ boat measurement methods at the Point Beach Power Plant were compared on five occasions. Thermal scanning detects only surface temperatures but the data are acquired rapidly. In situ boat methods require longer times (about one hour to sufficiently define a plume) but temperatures can be measured with depth. Good agreement between the two methods was found with respect to plume features such as contour configurations, areas,

centerline temperature decays, and upwelling factors. (See also W76-12770) (Chilton-ORNL)

NEAR SHORE LAKE CURRENT INVESTIGATIONS,
Argonne National Lab., Ill.
D. E. Frye, L. S. Van Loon, A. A. Frigo, and S. M. Zivi.
In: Measurements of Physical Phenomena Related to Power Plant Waste Heat Discharges: Lake Michigan, 1973 and 1974. p 246-327, 28 fig, 3 tab, 4 ref. W-31-109-Eng-38.

Descriptors: *Thermal pollution, *Currents(Water), Shores, Winds, Wind velocity, Velocity, Current meters, Lakes, *Lake shores, Path of pollutants.
Identifiers: *Lake currents.

The data showed that nearshore curents to depths of three or more meters are closely correlated to the local wind field with the current speed generally being 1-3% of the wind speed. Time response of these currents was typically a few hours or less. While flow perpendicular to shore did occur and may be significant in terms of mixing a shoreline discharged effluent with offshore water, the currents in the nearshore regions were found to be predominantly in the alongshore directions. Assuming that a bidirectional current describes the nearshore regime, the direction of the flow could be predicted more than 80% of the time from the local wind direction. Bottom friction plays an important role in the inhibition of currents in the nearshore waters. (See also W76-12770) (Chilton-ORNL)
W76-12774

FIELD OBSERVATION OF THE DYNAMICS OF HEATED DISCHARGE JETS,
Argonne National Lab., Ill.
A. A. Frigo, S. M. Zivi, R. F. King, and E. D. Levinson.
In: Measurements of Physical Phenomena Related to Power Plant Waste Heat Discharges: Lake Michigan, 1973 and 1974. p 328-348, 11 fig, 1 tab, 3 ref. W-31-109-Eng-38.

Descriptors: *Thermal pollution, *Heated water, *Discharge(Water), Hydrodynamics, On-site investigations, Model studies, *Lake Michigan, Great Lakes, *Jets, Path of pollutants.

The results of an initial effort to examine the possible dynamical character of heated discharges is discussed. Hydrodynamic and thermal oscillations of measurable amplitude within thermal plumes were noted. Higher frequency oscillations for the Point Beach plant are postulated to be a manifestation of the eddy phenomenon that is active initiating the lateral dispersal of the plume. Such oscillations could cause ramifications in presently used boat techniques for measuring thermal plumes and in regulatory criteria governing heated discharges. (See also W76-12770) (Chilton-ORNL)

AN ANALYTICAL METHOD FOR DETERMINING HEAT TRANSFER FROM POWER PLANT COOLANT IN THE FLORIDA BOULDER ZONE,
Army Facilities Engineering Support Agency, Fort Belvoir, Va. Research and Technology Div.
M. Greenberg, and A. J. Van den Berg.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A010 432, $4.00 in paper copy, $3.00 in microfiche. Report RT-2000, July 1974, 35 p, 9 fig, 3 tab, 5 ref, 3 append.

Descriptors: *Heat transfer, *Cooling water, Heated water, Thermodynamics, Powerplants, *Florida, Geologic formations, Stratigraphy, *Path of pollutants.

The proposal suggests that a desk study and a field demonstration be conducted to investigate the receptivity and transmissivity of the geological strata underlying south Florida as a means of dissipating heat from power plant coolant at 83 degrees F. The concept of injecting the coolant into this strata, allowing a fresh water bubble to displace sea water and to form and cool for 30 days before being recirculated back to the plant is considered. It was concluded that the average temperature of the bubble would be 68.3 F with approximately 37% of the total water discharged at 61 F and 17% at 83 F. The remaining water would be a mixture at about 73.5 F. (Chilton-ORNL)

Identifiers: Chemical dynamics, Polluted watersheds, *Merrimack River, Northern New England, Flux models, Flow models.

A time series of the major-ion and nutrient composition of the Merrimack River was obtained at several locations on the main channel over a one-year period. Combination of the chemical data with the flow allowed chemical mass fluxes to be calculated and the major chemical inputs modeled. Sodium, calcium, magnesium, and potassium showed significant anthropogenic input (greater than 50%) as well as natural input; phosphate was predominantly anthropogenic while silicate was predominantly natural. It was found that the dependence of concentration on flow can be modeled for some constituents using two input components. The first component had a constant mean composition and steady flux and was identified as groundwater and sewage. The other components had a mean composition which was flow dependent and was identified with runoff events. (Henley-ISWS)

e fate of N-nitroso dimethyl amine (NDMA) in eous solutions and in a 25% caustic waste eam, which is produced in the manufacture of ymmetrical dimethyl hydrazine (UDMH) was died. The conditions were intended to approxi-e those which would effect evaporation, radation, or both of NDMA in an open lagoon. MA in aqueous solutions is easily evaporated photolyzed. Evaporation accounted for most he removal in basic solutions, was low for acid tions, and accounted for half the removal in tral solutions. The rate of photolysis is higher cid solutions. In acid and neutral pHs, nitrite erely inhibited the photolysis of NDMA. The poration rate was slightly increased by an in-se in ionic strength. These results imply that majority of the NDMA will volatilize from the tions very rapidly unless the waste is neutral-l. If the waste is neutralized and the heat of tralization does not distill off the NDMA, tolysis will predominate unless nitrite is ent. If nitrite were present in this situation, lit-f the NDMA would leave the lagoon eiher by tilization or photolysis. (Snyder-FIRL)

EFFECT OF THE SOIL MOISTURE REGIME ON THE PASSAGE OF STRONTIUM-90, CESIUM-137 AND CERIUM-144 FROM SOIL INTO SOLUTION, (IN RUSSIAN),
Ural Science Center, Sverdlovsk (USSR). Inst. of Plant and Animal Ecology.
N. V. Kulikov, I. V. Molchanova, and E. N. Karavaeva.
Ekologiya. 4(4), p 57-62, 1973.

Descriptors: *Soil moisture, Soils, Path of pollutants, *Radioisotopes, Distribution, Water pollution sources.
Identifiers: *Cerium-144, *Cesium-137, *Strontium-90.

The distribution of 3 radionuclides (Sr90, Cs137 and Ce144), differing in physicochemical properties, in the soil-solution system was studied upon changing the relationship of the solid and liquid phases of the soil within wide limits. Experiments established that with an increase of the soil moisture content, the quantity of Cs137 and Ce144 increases markedly in an equilibrium solution, whereas the content of Sr90 changes less appreciably. Seasonal differences of soil moisture under natural conditions are probably a cause of leveling of the rate of vertical migration of these radionuclides in soil.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: Ocean dumping, Oceanographic cruises, Oceanographic surveys, *Middle Atlantic Bight.

An oceanographic cruise was made in the fall of 1973 to an interim municipal sludge dumpsite and an interim industrial acid waste dumpsite which had been studied on a similar cruise the previous spring. These sites are on the continental shelf in the Middle Atlantic Bight. Hydrographic and bathymetric conditions, major circulation patterns, water quality, sediment composition, heavy metals in sediments and biota, bacteriology, phytoplankton and zooplankton communities, vertebrates, and benthic invertebrates were studied. Temperature and salinity profiles indicated the presence of a pycnocline, but differences between surface and bottom waters were relatively small. Neutral buoyance seabed drifters left by the previous cruise indicated net bottom water movement toward the west and southwest toward the Delaware, Maryland, and Virginia beaches. Nutrient concentration in waters near the bottom varied seasonally. Elevated nitrate plus nitrite concentrations occurred in bottom waters at the municipal sludge site. Phytoplankton populations were characteristic of mid-temperate coastal communities during fall and winter. Higher mercury, nickel, and manganese concentrations in zooplankton samples than from the previous cruise suggest that certain metals may accumulate in zooplankton. Geographic distribution patterns indicate deposition of heavy metals in sediments as a result of waste disposal. Iron concentrations in sand dollars were less than during the spring cruise. A mechanism is postulated in which accumulation at the pycnocline makes iron less available to the bottom community. (Snyder-FIRL)

BEHAVIOR OF CESIUM-137 IN SOILS AND SOIL-PLANT SYSTEMS, (IN POLISH),
Polish Academy of Sciences, Warsaw. Agricultural Isotopes Lab.
K. Smierzchalska.
Postepy Nauk Roln. 20(1), p 89-107, 1973.

Descriptors: *Radioisotopes, Radioactivity, *Fallout, *Soil-water-plant relationships, Metabolism, Europe, Soils, *Strontium radioisotopes, Sorption.
Identifiers: *Cesium-137, *Poland.

General comments on the intake of radioactive fallout by plants are presented. Cs-137 and Sr-90 con-

stitute dangerous components of radioactive fallout. Investigations on radioactive pollution are of 2 types: control of Cs-137 and Sr-90 content in soils, waters and precipitation and behavior of various radionuclides in soil-plant-animal-man systems. The average Cs-137 content in Polish soils is given. Assimilability of Cs-137 in the soil-plant system is discussed, including sorption and desorption of Cs-137 in soils. The presence of certain ions and their concentration in the solution-sorption system can modify the reaction of Cs-137 sorption and desorption in soils.--Copyright 1975, Biological Abstracts, Inc

POPULATION BALANCE USE IN DILUTE IMPURITY PROBLEMS,
Iowa State Univ., Ames. Dept. of Nuclear Engineering; and Iowa State Univ., Ames. Dept. of Chemical Engineering.
J. D. Stevens, and P. M. Schierholz.
Journal of the Environmental Engineering Division-ASCE, Vol. 102, No. EE2, p 337-346, April, 1976. 4 fig, 5 ref, 2 append.

Descriptors: *Waste water treatment, *Analytical techniques, *Chemical precipitation, *Particle size, *Nucleation, Growth rates, Flow rates, Equations, Model studies, Calcium compounds, Crystallization, *Waste dilution.
Identifiers: *Population balance.

The population balance for chemical processes and its applications are introduced. In systems in which precipitation occurs, a population balance permits the characterization of crystal size distribution (CSD) in terms of the birth rate (nucleation), the growth rate, and, if applicable, the death rate. The population balance states that the number of discrete particles must be conserved, and if birth, death, and flow rates are properly represented then all particles can be accounted for. An equation providing a functional relationship between size and population density is derived from the population balance. The technique for obtaining kinetic models for nucleation and growth rate is illustrated. Application of the techniques in a study of the precipitation of calcium carbonate when solutions of calcium sulfate and sodium carbonate are mixed in a continuous crystallizer is described. The analytical approach is useful for processes involving sludge return. The population balance analysis approach is applicable to many environmental situations in which a dilute amount of solute is removed by crystallization. The CSD can be used to derive kinetic relationships used to predict effects of operating changes on the process. (Snyder-FIRL)

FATE OF METALS IN WASTEWATER DISCHARGE TO OCEAN,
CDM, Inc., Pasadena, Calif.
N. K. Rohatgi, and K. Y. Chen.
Journal of the Environmental Engineering Division-ASCE, Vol. 102, No. EE3, p 675-685, June, 1976. 6 fig, 4 tab, 9 ref, append.

Descriptors: *Pollutant identification, *Waste water(Pollution), *Discharge(Water), Oceans, *Deposition(Sediments), Cadmium, Copper, Nickel, Lead, Zinc, *Path of pollutants, *California, Bays.
Identifiers: *Santa Monica Bay(Calif).

Experimental results on the settling velocity of sludge solids were used to determine the annual deposition of trace metals on the Santa Monica Bay floor. Trace metal concentrations around the outfall areas are generally lower than the corresponding metal concentrations in the waste effluent particulates. Calculations indicate that approximately 30% of the total solids discharged will be deposited in the sediment and the remainder transported at 0.1 m/sec. About 10% of the total of cadmium, copper, nickel, lead, and zinc will be deposited within 2 km of the outfall. Predictions using experimental data indicate that a significant amount of soluble trace metals will be made available to marine organisms from the discharge of waste water effluent. Their validity can be argued because of the size and complexity of the ocean system. It is certain, however, that only a small portion of trace metals from waste water suspended particulates is represented by the Santa Monica Bay sediment, the remainder being mobilized into the ocean as soluble trace metals. Sludge was mixed with three soils with widely different properties and incubated, then the mixture was seeded with lettuce and tomato. The soils used were Fox sandy loam (sl), Granby sl, and Rideau clay (c). Sludge addition increased soil pH, total carbon, sodium-bicarbonate extractable phosphorus, cation exchange capacity, and exchangeable calcium. DTPA-extractable cadmium increased 2 to 5 times, lead 2 to 3 times, copper 3 to 7 times, and zinc 7 to 31 times. Incubation for 11 months did not greatly change metal extractability in Granby and Fox sl soils, but extractable zinc, copper lead, and cadmium were reduced in the clay soil following incubation. Raising lettuce reduced the quantity of metal extracted from Fox sl soil and, to a lesser extent, from Rideau c soil, but not from Granby sl soil. Lettuce yields were significantly reduced for the first crop grown on Rideau c and Granby sl soils mixed with fertilizer and sludge compared to yields produced by these soils treated with fertilizer only. All three harvests were reduced with sludge-treated Fox sl soil. The yield reductions for the first two soils were attributed to a salt effect. Raising crops decreased the saturation extract conductivities for all sludge treated soils. Generally, zinc, copper, and lead tissue concentrations in lettuce from Fox and Gra
by sl soils were significantly increased but tot
uptake was only increased for zinc. Metal uptal
and tissue concentrations for lettuce grown
Rideau c soil treated with sludge and fertiliz
were equal to or less than in lettuce from Rideau
soil treated with fertilizer only. Similar tren
were observed to a lesser extent with tomato

simulation model describing nitrate movement ough a potato-cropped Plainfield loamy sand s described. Physical processes modeled inded dispersion, convection, plant uptake, rification, and mineralization. The soil water w regime was treated approximately by dividing soil profile into three layers between the surce and the water table and generating water flux water content profiles by solving a series of ss balance equations which include submodels evapotranspiration and internal drainage. This ormation was combined with the solute equan and was solved numerically by the finite elent method. Model predictions of nitrate movent often qualitatively agreed with field data en symmetrically comparable profiles were d. Nonuniform infiltration across the hill-fur- unit induced large local variability in solute nsport. Predicted and measured nitrate concenions in lysimeter leachates were in closer eement when the nonuniform infiltration patn was incorporated into the model. (Visocky - VS)

Identifiers: *Phelps County(Mo).

The existing quality of Phelps County, Missouri groundwater in the depth zone most commonly penetrated by nonpublic wells was defined. Information from 675 water wells showed that discrete areas of differing groundwater quality can be identified and mapped. It was learned that the best quality groundwater, as judged by its low nitrate content and coliform bacteria density, is found in areas of relatively little agricultural (pasture and livestock) land use; the poorest quality is found in areas of intensely developed karst and greater agricultual land use; the adverse effect of agricultural land use on groundwater quality is more severe in the intensely developed karst than in the less intensely developed; rural population density and soil association variations have no readily discernible effects on groundwater quality; nitrate content varies seasonally and in response to rainfall, and decreases with increasing well depth; coliform bacteria density is positively correlated with nitrate content. NUTRIENT LOSSES IN SURFACE RUNOFF FROM WINTER SPREAD MANURE,
Wisconsin Univ., Madison, Dept. of Agricultural Engineering.
J. C. Converse, G. D. Bubenzer, and W. H. Paulson.
Transactions of the American Society of Agricultural Engineers, Vol. 19, No. 3, p 517-519, May-June 1976. 1 fig, 6 tab, 10 ref. OWRT B-076-WIS (6).

Descriptors: *Agricultural runoff, *Farm wastes, *Agricultural watersheds, *Water pollution sources, *Nutrients, *Wisconsin, Precipitation, Nitrogen, Phosphorus, Potassium, Alfalfa, Winter.
Identifiers: Ammonium.

Runoff and nutrient losses from ten alfalfa plots were monitored for a 3 year period. Each plot was 13.2 m by 3.0 m, with slopes ranging from 10 to 12%. Dairy cattle manure was applied to two plots in the fall winter, and spring at the rate of 2.25 kg/sq m (wb). The remaining four plots served as checks. Runoff was measured using tipping buckets and proportionally sampled for nutrient analysis. Annual precipitation for the 3 year period ranged from 1054 to 1088 mm, with 12% as snow. The average annual runoff from the check and the fall, winter, and spring applied manure plots was 136, 73, 104 and 106 mm, respectively. No significant differences were observed in the nutrient losses from the various treatments. Losses for the third year were greater than the previous 2 year period and were attributed to the higher percentage of total runoff that occurred as surface runoff during the 1973-74 winter months as compared to earlier years. TWO-DIMENSIONAL WATER QUALITY MODELING AND WASTE TREATMENT OPTIMIZATION FOR WIDE, SHALLOW RIVERS,
Wisconsin Univ., Madison.
J. W. Eheart.
Ph.D. Thesis, 1975, 371 p.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, Analytical techniques, *Biochemical oxygen demand, Water quality standards, *Mathematical models, Waste treatment, Optimization, Rivers, Model studies, Path of pollutants, *Dissolved oxygen, Distribution.

A mathematical model was developed for two-dimensional steady-state dissolved oxygen and biochemical oxygen demand (BOD) distribution from the discharge of treated sewage into a wide, shallow river. The results produced by the model were compared with the results of simpler models in a hypothetical case. The implications of the assumptions upon which the simpler models are based are discussed. The model was tested with field data and found to be slightly more accurate than a variation of the model which assumes the channel to be prismatic, and much more accurate than a simpler model assuming a rectangular channel with plug flow. The clearlane was defined as a means to specify standards for ambient water quality. The model and linear programming were used in determining the optimal strategy for sewage treatment for a hypothetical river basin with specified clearlane standards. The dependence of the optimal strategy on the clearlane location was investigated. (Snyder-FIRL)

WATER QUALITY MODEL OF A SALT-WEDGE ESTUARY,
Geological Survey, Tacoma, Wash.
E. A. Prych, and W. L. Haushild.
In: Symposium on Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1138-1155, 1975. 8 fig, 9 ref.

Descriptors: *Model studies, Numerical analysis, Water quality, *Saline water intrusion, *Estuaries, Methodology, *Salinity, *Water temperature, *Chlorophyll, *Dissolved oxygen, Biochemical oxygen demand, Tidal effects, *Path of pollutants, *Washington.
Identifiers: *Duwamish River estuary(Wash).

A numerical model has been developed and used to calculate salinity, temperature, chlorophyll a (phytoplankton) concentration, biochemical oxygen demand, and dissolved-oxygen concetration in the Duwamish River estuary, Washington. In the model, the estuary is divided vertically into the wedge and the upper layer; the latter is divided into three sublayers. Longitudinally, the estuary is divided into about 35 segments; laterally, the estuary is assumed to be homogeneous. The wedge model is Lagrangian, and the upper-layer model is Eulerian in a coordinate system that moves with the fluid in the wedge. All velocities are computed using conservation-of-volume equations, observed data, and tide stages. The fluid-transport processes modeled are longitudinal advection and dispersion in the wedge; entrainment from the wedge to the upper layer; and longitudinal advection, vertical advection, and vertical diffusion in the upper layer. Biochemical and other physical processes that affect the constituent concentrations are also simulated. The computed concentrations agreed reasonably well with observed data. SUBLACUSTRINE FAN MORPHOLOGY IN LAKE SUPERIOR,
Geological Survey, Menlo Park, Calif.
W. R. Normark, and F. H. Dickson.
American Association of Petroleum Geologists Bulletin, Vol 60, No 7, p 1021-1036, July 1976. 10 fig, 1 tab, 30 ref.

Descriptors: *Sediment distribution, *Sedimentation rates, *Tailrace, *Mine wastes, *Lake Superior, Model studies, Lake morphology, Sedimentology, Cores, Sampling, Bottom sediments, Minnesota, *Path of pollutants.

Taconite ore tailings discharged into Lake Superior off Silver Bay, Minnesota, have formed a fan-like feature 20 sq km in area with a morphology and surface-sediment distribution comparable to that of many submarine fans. Two subparallel, leveed fan valleys extend across the upper fan from the base of a virtually unchannelled delta slope. The western fan valley is the deeper of the two, and its western or righthand (for the downstream direction) levee is higher and wider than its eastern levee, which is shared with the adjacent valley. Although both fan valleys terminate in low-relief suprafans, apparently the larger, western valley has been the primary pathway for sediments transported to the fan. The valleys give way to many small channels on the suprafans, which represent the only appreciable tailings deposition in the mid-fan area. Most of the tailings on the fan are silt-sized deposits that make up the levee complexes of the upper fan. The coarsest sediment (to coarse sand) is confined to the fan-valley floors and suprafan areas. Deposition has been insufficient to form the low half-cone physiography common to middle and lower fan segments on submarine fans. The growth pattern of Reserve fan is comparable to that of submarine fans off the California coast, primarily because of the wide range in grain size of sediment supplied (clay to coarse-pebble grade), and has developed in only 17 years owing to the very high rate of sedimentation, as much as 1.1 m/year on the upper fan. (Woodard-USGS)

FACTORS AFFECTING DECLINING WATER LEVELS IN A SEWERED AREA OF NASSAU COUNTY, NEW YORK,
Geological Survey, Albany, N.Y.
M. S. Garber, and D. J. Sulam.
Journal of Research of the U S Geological Survey, Vol 4, No 3, p 255-265, May-June 1976. 12 fig, 1 tab, 15 ref.

Descriptors: *Groundwater, *Drawdown, *Analog models, *Sewerage, *Water levels, Effects, *New York, Pumping, Sewers, Sewage treatment, Cesspools, Septic tanks, Groundwater movement, Hydrographs, Mass curves.
Identifiers: *Long Island(NY), *Water level declines.

Double-mass-curve analysis of ground-water levels in Nassau County, Long Island, N.Y., shows that the average-weighted ground-water levels in a 32 sq mi segment of a sewered area declined 11.8 ft relative to an adjacent unsewered area to the east during 1953-72. Electric-analog-model analysis indicates that 4.9 ft of the decline due to pumping in nearby Queens County, west the sewered area. Most of the remaining 6.9 ft the decline is due to sewering. Streamflow with the sewered area has also declined because of lowered ground-water levels. (Woodard-USGS)

DePaul Univ., Chicago, Ill.
T. J. Murphy, and P. V. Doskey.
Report EPA-600/3-75-005, December 1975. 35 fig., 10 tab., 25 ref. R-802647.

Descriptors: *Phospho *Precipitation(Atmospheric), *Lake Michig Rain, Phosphates, Hydrogen ion concentrati Snow, Fallout, Air pollution effects, *Path of lutants.

Samples of precipitation collected from six lo tions around Lake Michigan were analyzed for ferent forms of phosphorus. The atmospher presently contributing 1 million kilograms phosphorus per year or about 18% of phosphorus budget of the Lake. When phosphorus removal program on sewage efflu becomes fully implemented in the Lake Michi basin, the phosphorus contribution to the L from particulate matter scavenged by precipita could increase to about 30% of the total. average phosphorus concentration in precipita was about three times the 0.008 mg/l concen tion found in the Lake. The phosphorus concen tion in precipitation was higher at the south en the lake. Over 40% of the phosphorus in precip tion was dissolved reactive phosphate thus is mediately available to Lake organism. The amo of dissolved reactive phosphate in precipita was somewhat dependent on sample pH. Wash ratios for phosphorus by precipitation were de mined. Analysis of glacial samples indicated phosphorus has been a component of precipita for at least three centuries. Dry fallout also c tribute phosphorus to the Lake. Before filtra of samples for determination of dissolved reac phosphate, pH should be stipulated for equilib ing samples. (Buchanan-Davidson--Wisconsin)

5C. Effects Of Pollution

SOME PHYSIOLOGICAL EFFECTS OF NEAR-MAXIMUM GROWTH TEMPERATURES ON AN OBLIGATELY PSYCROPHILIC MARINE BACTERIUM,
Oregon State Univ., Corvallis. Dept. of Microbiology.
G. G. Geesy, and R. Y. Morita.
Canadian Journal of Microbiology, Vol. 21, No. 6, 1975, p 811-818, 8 fig, 2 tab, 12 ref. NSF Ga 38583X.

Descriptors: *Physiological ecology, Animal physiology, Temperature, Thermal stress, Bacteria, Environmental effects.

Ant-300 is an obligate psychrophile, having a temperature optimum for growth of 7 C, and failing to grow above 13 C. Heat inactivation of the bacterium was investigated in terms of glucose uptake, the oxidation of glucose to carbon dioxide, and permeability control. Upon initiation of heat shock, carbon dioxide evolution from oxidation of glucose increased but as duration of shock continued, a decrease of glucose oxidation occurred. Data indicated that heat inactivation of cellular processes occurs at temperatures as low as 13 C. It was concluded that it was impossible to determine from these studies whether the time and temperature-dependent decrease in glucose accumulation was caused by heat-induced restrictions on the transport system mediating glucose uptake, or by loss of intracellular glucose through leakage. Data suggested that the cell envelope was damaged. (Chilton-ORNL)

SURVEY FOR RADIOACTIVITY IN A SWAMP,
Du Pont de Nemours (E. I.) and Co., Aiken, S.C. Savannah River Plant.
J. E. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as DPSPU 75-30-8, $3.50 in paper copy, $3.00 in microfiche. DPSPU 75-30-8, Paper for presentation at the Third Environmental Protection Conference, September 23-25, 1975, held in Chicago, 10 p, 4 fig, 5 tab. AT(07-2)-1.

Descriptors: *Environmental effects, *Radioactivity, *Monitoring, *Swamps, South Carolina, Surveys, Pollutant identification.
Identifiers: Savannah River Plant(SC).

During periods of high water, Savannah River Plant effluents are diverted through a swamp and across the downstream plant boundary. An estimated 25 curies of cesium 137 and less than 1 curie of cobalt 60 have been deposited in an offsite location. Aerial and ground surveys indicated dose rates generally below 60 microR/hr. with a maximum of 120 microR/hr. Soil samples contained Cs137 ranging from less than 1 to 525 pCi/g in the top 7.5 cm. Vegetation contained from 1 to 235 pCi/g and wildlife from less than 1 to 15 pCi/g in edible tissue. Monitoring to date shows that the swamp sediments are immobile. No restrictions on use of the swamp are warranted. No increases in radioactivity are expected to occur but the swamp will be monitored annually to evaluate possible redistribution of the Cs137. (Chilton-ORNL)

EFFECTS OF 1973 RIVER FLOOD WATERS ON BROWN SHRIMP IN LOUISIANA ESTUARIES,
Louisiana Wildlife and Fisheries Commission, New Orleans. Div. of Oysters, Water Bottoms and Seafoods.
C. J. White.
Technical Bulletin No. 16, August 1975, 24 p, 18 fig, 26 ref.

Descriptors: *Environmental effects, *Floods, *Shrimp, *Estuaries, *Louisiana, Hydrology, Temperature, Salinity, Growth, Dispersion, Mortality.

Adverse hydrological conditions occurred along the Louisiana coast during March, April, and May of 1973 and were the result of record flood discharges, primarily from the Mississippi and Atchafalaya river systems. Local flooding existed on the many smaller rivers confluencing on the Louisiana coast to further compound the problem. Shrimp conditions that existed prior to the flood crisis were comparable to preceding years in areas of primary production. Hydrological conditions (salinity and temperature) that prevailed following the post larvae in 1973 were not conducive to brown shrimp growth, dispersal, and survival. This resulted in a considerable loss to the industry and the total impact should be felt for some time. (Chilton-ORNL)

CORRELATION OF RADIOACTIVE WASTE TREATMENT COSTS AND THE ENVIRONMENTAL IMPACT OF WASTE EFFLUENTS IN THE NUCLEAR FUEL CYCLE FOR USE IN ESTABLISHING AS LOW AS PRACTICABLE GUIDES-FABRICATION OF LIGHT-WATER REACTOR FUELS CONTAINING PLUTONIUM,
Oak Ridge National Lab., Tenn.
W. S. Groinier, R. E. Blanco, R. C. Dahlman, B. C. Finney, and A. H. Kibbey.
Available from the National Technical Information Service, Springfield, VA 22161, as ORNL-TM-4904, $6.75 in paper copy, $3.00 in microfiche. Report ORNL-TM-4904, May 1975, 140 p, 19 fig, 34 fig, 74 ref, append. W-7405-eng-26.

Descriptors: *Cost-benefit analysis, *Nuclear wastes, Model studies, Nuclear engineering, *Radioactivity, Plutonium, *Waste treatment, Cost analysis.
Identifiers: Fuel fabrication plants, Light water reactors.

This cost-benefit study uses a base case model plant which is representative of current plant technology and has an annual capacity of 300 metric tons of uranium and plutonium (as metal). Three conceptual gaseous radwaste treatment cases and their corresponding flowsheets were prepared for treating the wastes from the model plant. The base case represents the lowest cost and current practice. In each of the succeeding cases, gaseous radwaste treatment was added to accomplish specific objectives. The cost for the added waste treatment operations and the corresponding dose commitment are calculated for each case. Methodology for estimating the costs and the radiological doses, detailed calculation, and tabulations are presented. (Chilton-ORNL)

ENVIRONMENTAL STATUS OF THE LAKE MICHIGAN REGION, VOLUME 3. CHEMISTRY OF LAKE MICHIGAN,
Wisconsin Univ., Madison. Water Chemistry Lab.
M. S. Torrey.
Report ANL/ES-40, Vol. 3, May 1976, 418 p, 115 fig, 81 tab, 3 append, 431 ref. W-31-109-Eng-38.

Descriptors: *Data collections, *Chemistry, *Lake Michigan, Water quality, Effluents, Chemicals, Sediments, Water quality standards, Lake sediments, Lakes, Lake sediments.

Summarizes are presented chemical data collected in Lake Michigan and its two major embayments, Green Bay and Grand Traverse Bay, over the past twenty years. Concentrations of chemicals found in offshore waters which represent water quality least affected by man are compared with levels found in nearshore waters which in many cases have been appreciably altered by human activities. Concentrations of nutrients and toxicants are surveyed and compared with levels currently judged acceptable for the maintenance of human health and the propagation of desirable aquatic organisms. Sedimentary behavior of chemicals and external factors modifying the chemistry of the lake (erosion, weathering, municipal and industrial effluents, dry fallout and precipitation, and nonpoint surface and subsurface inputs) are considered. PRELIMINARY EVALUATION OF THE RADIOLOGICAL QUALITY OF THE WATER ON BIKINI AND ENEU ISLANDS,
California Univ., Livermore. Lawrence Livermore Lab.
V. E. Noshkin, K. M. Wong, R. J. Eagle, and G. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as UCRL-51971, $3.50 in paper copy, $3.00 in microfiche. Report UCRL-51971, December 1975, 19 p, 5 fig, 6 tab, 12 ref. W-7405-Eng-48.

Descriptors: *Water quality, *Path of pollutants, Water quality standards, Radiosotopes, Water wells, Groundwater, Water pollution.
Identifiers: Bikini Islands.

The objective of the survey repoted upon was to evaluate the potential radiation doses that could be received by persons returning to the islands of the Bikini Atoll. Data was obtained from water samples collected at old and new well sites on both Bikini and Eneu Islands and from the cistern water on Bikini Island. The radiological quality of the groundwater varied from one location to another on both islands. Assessment of the chemical quality of the ground water showed that, by U. S. Public Health Standards, the ground water at two stations on Eneu and one station on Bikini would be considered brackish; at one station on Eneu and two on Bikini it appeared to be potable; and at one station on Eneu and three on Bikini the water was chemically acceptable for drinking, household and agriculture purposes if the taste could be tolerated. The cistern water on Bikini Island was both chemically and radiologically acceptable as drinking water. On Eneu Island, the radionuclide concentrations varied among the ground water samples. Therefore, a complete dose assessment of all pathways must be completed before this water is recommended as usable. (Chilton-ORNL)

ON THE COEXISTENCE OF SCAVENGERS ON SHALLOW SANDY, BOTTOMS IN GULLMAR FJORD (SWEDEN), ADAPTATIONS TO SUBSTRATUM, TEMPERATURE, AND SALINITY,
Uppsala Univ. (Sweden). Inst. of Zoology.
S. Eriksson, S. Evans, and B. Tallmark.
ZOON, Vol. 3, 1975, p 65-70, 4 tab, 1 fig, 11 ref.

Descriptors: *Ecology, *Scavengers, Niches, Adaptation, *Temperature, *Salinity, Sands, Resistance, Bottom sediments, Fjords.
Identifiers: *Substratum, Gullmar Fjord(Sweden).

The adaptations of dominant scavengers to substratum, temperature, and salinity were investigated in the laboratory. Responses to substratum were studied in two-choice experiments and responses to temperature and salinity in tolerance experiments. Crangon vulgaris and Nassarius reticulatus principally chose soft substratum, Pagurus bernhardus and Asterias rubens L. preferred hard substratum with Carcinus maenas being intermediary between the groups in preference. Temperature tolera (100% survival) were ranked in the follo order Nassarius reticulatus (0-33 degrees C), cinus maenas (0-33C), Crangon vulgaris (0-2 Pagurus bernhardus (0-24C), and Asterias ru (0-22C). Salinity tolerances were ranked in the lowing decreasing order: Carcinus maenas 54%), Crangon vulgaris (3-45tb), N. reticulatu 45%), P. bernhardus (14-43%), and A. rubens 38%). The species showing the largest over-ca ty for this biotope were those preferring sha bottoms and soft substratum. (Chilton-ORNL)

Identifiers: Ceramiales.

The effect of light, temperature and salinity photosynthesis and respiration of four marin algae were investigated. Cold water plants (a photosynthesis as low as 5 degrees C with photosynthesis at 21-24 C) showed signs of mal stress at temperatures of 25 C and a na tolerance to low salinities at high temperature peratures. Plants with warm water affinities or no photosynthesis below 10 degrees C and peak photosynthesis at 27-30 C) showed sig thermal stress at 30 C and had a wider toleran low salinities. Light optima for the four speci respect to their habitats, was comparable to intertidal and subtidal red algae. Horizontal tribution was primarily governed by tolerances to high temperatures and low salin Good correspondence was found between na distribution patterns and manometric re (Chilton-ORNL)

iers: *Coho salmon.

Juvenile rainbow trout and coho salmon were exposed to infection with Ceratomyxosis shasta and then groups of the fish were held at various temperature levels increasing from 3.0 to 23.3C by 2.8C increments. Rainbow trout deaths did not occur at 3.9C but at the other experimental temperatures mortality averaged about 80% over a period of 237 days. No coho salmon deaths occurred at 3.9 or 6.7C but at other temperatures mortality increased progressively from 2% at 9.4C to 22% at 15.0C and 84% at 20.5C. The geometric-mean time from exposure to death in rainbow trout was a function of temperature increasing from 14 days at 23.3C to 155 days at 6.7C . The geometric-mean time from exposure to death of coho salmon increased from 12.5 days at 23.3C to 146 days at 9.4C. (Chilton-ORNL)

Descriptors: *Distribution patterns, *Fish, *Thermal pollution, Temperature, On-site investigations, Environmental effects, Water pollution effects, *Virginia.
Identifiers: *New River(Va).

By applying multivariate screening techniques to comprehensive in situ fish data the influence of temperature on fish distribution was evaluated. The results of the study indicated that temperature was extremely importat to distributional patterns. The stoneroller, northern hog sucker, and rosyface shiner all avoided temperatures above 80 F. The channel catfish demonstrated a preference for temperature exceeding 91F, while the distribution of the spotfin shiner appeared to be unaffected by temperature. (Chilton-ORNL)

SEASONAL ABUNDANCE AND DISTRIBUTION OF MARINE FISHES AT A HOT-WATER DISCHARGE IN GALVESTON BAY, TEXAS,
Texas A and M Univ., College Station. Dept. of Wildlife Science.
B. J. Gallaway, and K. Strawn.
Contributions in Marine Science, Vol. 18, 1974, p 71-137, 44 tab, 11 fig, 38 ref.

Descriptors: *Water pollution effects, *Thermal pollution, *Fish, Seasonal, *Distribution, Temperature, Effluents, *Texas, *Marine fish, Bays.
Identifiers: *Galveston Bay(Tex).

Biological and hydrological data were collected monthly from January 1968-December 1969 at 17 stations in the discharge area of the P. H. Robinson Generating Station. Discharge waters were usually about 8C warmer on the surface and 7.4C warmer on the bottom than bay water temperatures. Most species of fish appeared attracted to the effluent except during periods when temperatures were too hot. General reaction to this condition was avoidance until the effluent cooled. The lowest elevated temperature a species was observed to avoid was 30 C by Gulf menhaden. Cooling of effluent waters is not recommended for periods other than summer. The presence of warm water during winter is normally beneficial. It was concluded that with proper siting and design, power plants could be used as tools to enhance non-productive areas of Texas estuaries as nursery grounds. (Chilton-ORNL)

INFLUENCE OF TEMPERATURE ON SEXUAL DEFFERENTIATION IN CRUSTACEA, (TEMPERATURE ET DIFFERENCIATION SEXUELLE CHEZ LES CRUSTACES),
Centre National de la Recherche Scientifique, Gif-sur-Yvette (France). Laboratoire de Genetique Evolutive et de Biometrie; and Centre National de la Recherche Scientifique, St. Cloud (France). Laboratoire de Sciences Naturelles.
T. Ginsburger-Vogel.
Bulletin de la Societe Zoologique de France, Vol. 100, No. 1, 1975, p 95-115, 3 fig, 4 tab, 80 ref.

Descriptors: Environmental effects, *Temperature, Biology, Gonads, *Crustaceans.
Identifiers: *Sexual differentiation(Crustaceans).

Temperature influence on sexual differentiation was investigated on cyclical parthenogenesis of Cladocera, sex-ration abnormalities among Copepods, and monogeny and intersexuality in Amphipods. Temperature appeared to play a role for sex realization in Daphnia magna with low temperatures favoring the appearance of amphigonic females and high temperatures the appearance of males. In the preferential elimination of sex chromosomes during meiosis in the Cyclops viridis temperature was also significant. Monogeny and intersexuality existing in some populations of Orchestia gammarella depended on temperature during the breeding of females and their broods. Broods with female excess and intersex males are obtained at 17 C while normal broods or with excess of males are obtained at 22 C. (Chilton-ORNL)

EARLY SURVIVAL AND RECRUITMENT OF SMALLMOUTH BASS IN NORTHERN MICHIGAN,
Institute for Fisheries Research, Ann Arbor, Mich.
M. D. Clady.
Journal of Wildlife Management, Vol. 39, No. 1, 1975, p 194-200, 1 fig, 5 tab, 10 ref.

Descriptors: *Ecology, *Environmental effects, *Bass, *Mortality, Growth stages, Temperature, Fish, Age, *Michigan, Water pollution effects.

Survival for six life history stages from egg to fall fingerling were estimated for the 1967, 1968, and 1969 cohorts of smallmouth bass. Percentages of egg potentials deposited on nests ranged from 15 to 34%. Survival between egg deposition and post-larval stage ranged from 26-33%. Strength of year class was significantly correlated with summer temperatures when cohorts were measured later in life but not when year classes were measured at the end of the first year. This might suggest that weather is important in determining survival subsequent to September of the first growing season. (Chilton-ORNL)
W76-12720

MORTALITY OF THE EARLY DEVELOPMENTAL STAGES OF THE ROACH- RUTILUS RUTILUS (LINNAEUS, 1758),
Karlova Universita, Prague (Czechoslovakia). Dept. of Systematic Zoology.
K. Cerny.
Vestnik Ceskoslovenske Spolecnosti Zoologicke, Vol 39, No. 2, 1975, p 81-93, 2 fig, 2 tab, 39 ref.

Descriptors: *Ecology, *Environmental effects, Fish, *Mortality, Larvae, Water temperature, Water pollution effects.
Identifiers: *Roach larvae.

Data showed that mortality of roach larvae was closely associated with temperature, lowest mortality occurring at the highest temperature. An average temperature of 8.9 degrees C was unsuitable for development. At this temperature, the larvae had difficulties in filling the swim bladder, locomotion was slowed and ability to catch food was impaired. In starved larvae, the decline of larvae was faster at higher temperatures. A sudden

increase in mortality was observed during the first days following the final resorption of the yolk sac. It was concluded that increased mortality of fishes during the early developmental stages is the result of complicated interactions of a number of external ecological and internal factors and that it is impossible to infer which of these factors is the decisive one. (Chilton-ORNL)

SOME EFFECTS OF TEMPERATURE, CHLORINE AND COPPER ON THE SURVIVAL AND GROWTH OF THE COON STRIPE SHRIMP, PANDALUS DANAE,
Battelle Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.; and Battelle Pacific Northwest Labs., Richland, Wash. Marine Research Lab.
C. I. Gibson, T. O. Thatcher, and C. W. Apts.
Report BNWL-SA-5344, 24 p, 3 tab, 2 fig, 12 ref.

Descriptors: *Environmental effects, *Mortality, *Growth rates, *Shrimp, *Water temperature, *Copper, *Chlorine, Thermal pollution, Water pollution effects, *Bioassay.
Identifiers: Critical Thermal Maximum.

From bioassays and growth rate experiments it was concluded that coon stripe shrimp are more resistant to chlorine when acclimated and exposed at 8-10 C than when acclimated at 8 C and exposed at 15-20 C or when acclimated and exposed at 15 C. The Critical Thermal Maximum increased with an increase in size and rate at which temperature was elevated. The optimal growing temperature for shrimp for periods up to one month was 16 C. Copper concentrations of 0.041 mg/1 retarded the growth at 16 C over a one month period. Chlorine concentration of 0.18 mg/1 was lethal at 16 C and reduced growth at 0.08 mg/1 over a one month period. (Chilton-ORNL)
W76-12722

SIMULATION EXPERIMENTS ON THE MIGRATION OF GAMMARUS ZADDACHI AND GAMMARUS CHEVREUXI,
Amsterdam Univ. (Netherlands). Inst. of Taxonomic Zoology.
H. B. Girisch, and H. G. Dennert.
Bijdragen tot de Dierkunde, Vol 45, No 1, 1975, p 20-38, 29 fig, 4 tab, 19 ref.

Descriptors: *Environmental effects, Migration, Aquatic animals, Diurnal, Temperature, Salinity, Tides, Currents(Water), Laboratory tests, *Fish migration.
Identifiers: *Gammarus zaddachi, *Gammarus chevreuxi.

A current chamber in which a tidal cycle could be simulated was used in the investigations of migratory activity of two species of Gammarus. The number of animals actively swimming against the current and the number drifting with the current was observed to be about equal. Migratory activity was influenced by population density and food supply as well as a diurnal periodicity. A combination of decreased current velocity followed by slow current in the opposite direction, with increased salinity and temperature caused a significant increase in activity of both species. An increase in one of these factors produced increased migratory activity to a lesser extent. No significant differences in migratory activities were seen between juveniles and adults. (Chilton-ORNL)

SPAWNING LITTORINA LITTOREA (L.) (GASTROPODA: PROSOBRANCHIATA),
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
J. Grahame.
Journal of Experimental Marine Biology and Ecology, Vol. 18, 1975, p 185-196, 6 fig, 2 tab, 15 ref.

Descriptors: *Biology, *Biorhythyms, *Spawning, *Gastropods, *Snail, Tides, Tidal effects.

Snails were collected from about mean tidal level and transferred to the laboratory for observation. Data showed good evidence for seasonality of breeding in the snails studied as well as diurnal and longer time scale fluctuations in spawn output. There was no evidence of any immediate effects by temperature fluctuations of 2-3C nor was there any evidence that transfer to the laboratory entrained a spawning rhythm. There were strong indications of a lunar/tidal rhythm in spawning. (Chilton-ORNL)

GROWTH AND MORTALITY OF TWO GROUPS OF OYSTERS, (CRASSOSTREA VIRGINICA GMELIN), MAINTAINED IN COOLING WATER AT AN ESTUARINE ELECTRIC POWER GENERATING STATION,
Moody Coll. of Marine Sciences and Maritime Research, Galveston, Tex. Dept. of Marine Sciences.
G. H. Gilmore, S. M. Ray, and D. V. Aldrich.
Report TAMU-SG-75-207, January 1975, 67 p, 9 tab, 16 fig, 38 ref. NASA 04-3-158-18.

Descriptors: *Environmental effects, *Thermal pollution, *Oysters, *Growth rates, *Mortality, Ponds, Discharge(Water), Intakes, Powerplants, Cooling water, Water pollution effects.

Growth and mortality of oysters which were infected with Labyrinthomyxa marina was measured in samples collected from ponds receiving a continuous flow of heated water from an electric power plant, from the power plant intake canal, and from the power plant discharge canal. Pond oysters grew better and had less mortality than intake canal oysters regardless of infection. Highest infection occurred at the head of the discharge canal during warm seasons. Oysters held in the ponds grew as well or better than oysters from a natural reef. Evidence of oyster reproduction was also noted in the ponds. Oysters placed in the discharge canal during warm weather died within six weeks. (Chilton-ORNL)

EFFECT OF TEMPERATURE ON TOLERANCE TO DISSOLVED GAS SUPERSATURATION OF BLACK BULLHEAD, ICTALURUS MELAS,
Battelle-Northwest, Richland, Wash.
D. H. Fickeisen, J. C. Montgomery, and R. W. Hanf, Jr.
Report BNWL-SA-5175, CONF-741033-1 from a workshop on Gas Bubble Disease held in Richland, Washington, October 8, 1974, 10 p, 5 fig, 3 ref. AT(45-1)-1830.

Descriptors: *Environmental effects, *Gases, *Temperature, *Bullheads, Bioassays, *Supersaturation, Resistance, Water pollution effects, Thermal pollution.
Identifiers: Acclimation temperature, *Gas bubble disease.

A progress report on continuing work is presented. Fish were acclimated to test temperature (8, 12, 16, and 20 degrees C) prior to exposure to supersaturation. The data were subjected to probit analysis and mean 96-hour TL50 values were 126.7% of equilibrium saturation at 8 degrees C, 125.1% at 12 C, 123.8% at 16C, and 124.4% at 20 C, indicating a slightly elevated tolerance at the lowest test temperature. It was concluded that the effect of temperature within the range tested had little effect on tolerance of black bullhead acclimated to the test temperature. It was suggested that the combined effects of thermal shock and supersaturation might produce a different effect. (Chilton-ORNL)

were 0.09, 0.5, and 0.8 mg/l. At the 0.8
oncentration 20% of the larvae died by the
the 96 hour exposure interval. No deaths
d at exposure concentrations of 0.09 and
/l cadmium. Exposure of larval spot to
d temperature regimes or suppressed dis-
oxygen levels showed significant decreases
two factors at cadmium concentrations of
0.8 mg/l. Significant reduction in the capa-
larvae to survive thermal stress or low dis-
oxygen after exposure to sublethal concen-
of cadmium demonstrates the potential
ntal effect of this metal in the marine en-
ent. (Chilton-ORNL)

DIATOM COMMUNITIES FROM A DELAWARE SALT MARSH,
Delaware Univ., Newark. Dept. of Biological Sciences.
M. J. Sullivan.
Journal of Phycology, Vol. 11, No. 4, 1975, p 384-390, 5 tab, 13 ref.

Descriptors: *Ecology, Water pollution effects, *Delaware, *Salt marshes, *Diatoms, On-site investigations, *Algae, Grasses, *Habitats, Temperature, Salinity, Distribution.

Edaphic diatoms were collected from 5 habitats of a salt marsh. Three of the habitats supported stands of grass while the other 2 were a bare bank and a panne. The habitats supporting grasses yielded the highest species diversity and the greatest number of diatoms. The bank and the panne were exposed to hypersaline conditions during warmer periods and this was considered a contributing factor to lower values for those habitats. The panne had the highest average temperature of the five habitats and the tall grass habitat had a surface temperature almost identical to the standing water temperature throughout the year. Each habitat supported its own unique and easily recognizable edaphic diatom community. Differences between the habitats were closely related to differences in temperature and elevation and to interactions between diatoms and filamentous algae. (Chilton-ORNL)

EFFECTS OF POLLUTION ON FRESHWATER FISH, (LITERATURE REVIEW),
National Water Quality Lab., Duluth, Minn.
J. M. McKim, D. A. Benoit, K. E. Biesinger, and W. A. Brungs.
Journal Water Pollution Control Federation, Vol. 47, No. 6, June 1975, p 1711-1768, 1 tab, 409 ref.

Descriptors: *Reviews, *Environmental effects, *Water pollution, Freshwater fish, Pollutants. Toxicity, Temperature, Water quality, *Bibliographies.

The effects of water pollution on freshwater is reviewed. Included in the review is information on methodology, water quality, pesticides, industrial pollutants, domestic and chlorinated pollutants and radioactive pollutants. A summary of the acute and chronic toxicity of inorganic and organic pollutants to freshwater fish, which provides information on species, exposure time, exposure type, temperature, effect endpoint, and concentration is provided. CESIUM 137 ACTIVITIES IN FISH RESIDING IN THERMAL DISCHARGES TO LAKE MICHIGAN,
Argonne National Lab., Ill. Radiological and Environmental Research Div.
S. A. Spigarelli.
Health Physics, Vol. 30, May 1976, p 411-413, 1 fig, 1 tab, 12 ref.

Descriptors: *Environmental effects, *Water pollution effects, *Radioactivity effects, Radioecology, *Thermal water, Fish, Cesium, Salmonids, Chinook salmon, Rainbow trout, Brown trout, *Thermal pollution.

The goals of the study were to compare Cs 137 activities in plume resident fish with fish from unheated areas, to compare the residence effect on three important sport fish(brown trout, Rainbow trout, and Chinook salmon), and to evaluate the radioecological significance of thermal discharge residence on temporal trends in Cs 137 accumulation by salmonid fish in Lake Michigan. In 1973, the mean Cs 137 activities in plume fish were higher than those of reference fish for each species. However, covariance analysis showed no statistical difference between plume and reference samples of rainbow trout or chinook salmon; the mean Cs 137 activity of plume brown trout was significantly higher than the mean activity of reference brown trout. It is concluded that differences in Cs 137 activities between species may be the result of differential feeding habits or metabolic requirements. (Chilton-ORNL)

WARM WATER EFFLUENTS AND PLANKTON, (IN JAPANESE),
Seikai Regional Fisheries Research Lab., Nagasaki (Japan).
M. Anraku.
Bull Plankton Soc Jpn. 21(1), p 1-31, 1974.

Descriptors: Cyanophyta, Algae, Diatoms, Effluents, Microorganisms, *Diatoms, Primary productivity, *Phytoplankton, *Dionoflagellates, Fish, *Zooplankton, *Thermal pollution, *Succession, Chlorophyta.

The influence of warm water effluents on the ecology and physiology of phyto- and zooplankton in inshore water is reviewed. A change of species composition of phytoplankton was observed in the field and in experimental pools following the addition of warm water effluents. The diatom population may be replaced by green algae with gradual increase of temperature and succeeded by a population of blue-green algae. On certain occasions, diatoms give way to dinoflagellates with increasing temperature. Species diversity is heightened with temperature rise, and the biomass of a single cell also increases. Since diatoms are more important as foods of microorganisms than are other algae, the succession from diatoms to other algal populations may change pathways of energy flow in a stable food chain system and thus influence the ecosystem. Primary productivity is variable in thermal effluents. Increased water temperature has either an inhibitive or a stimulative effect on the productivity depending on the temperature of the intake water. The study of the influence of warm water effluents on the production of zooplankton should be continued after the installation of a power plant. The increase of warm water species may induce a decrease of cold water zooplankton. The change of species composition may affect the feeding of their predators, especially in the early developmental stages of fish. In general, rates of metabolism and activity of zooplankton increase with increasing temperature over most of the species-specific temperature tolerance range and decrease suddenly near the upper limit. The rates of increase are usually different for different species, and frequently for different biological processes. The temperature rise with heated effluents accelerates the metabolic rates within the range of tolerance. Patterns of

energy flow might also be altered by changes in body size of individual species caused by temperature changes.--Copyright 1975, Biological Abstracts, Inc.

EFFECTS OF ACCLIMATIZATION AND PHYSIOLOGICAL STATE ON THE TOLERANCE TO HIGH TEMPERATURES AND REACTIONS TO DESICCATION OF THEODOXUS FLUVIATILIS AND LYMNEA PEREGRA,
Stockholm Univ. (Sweden). Dept. of Zoology; and Stockholm Univ. (Sweden). Asko Lab.
G. Skoog.
Oikos, Vol. 27, 1976, p 50-56, 6 fig, 2 tab, 18 ref.

Descriptors: *Laboratory tests, Environmental effects, *Temperature, *Snails, Drying, Seasonal, Physiology, Resistance, *Thermal pollution.
Identifiers: *Lymnea peregra, *Theodoxas fluviatilis.

Laboratory experiments showed that both adult and juvenile Lymnea peregra were more tolerant to high temperatures than Theodoxus fluviatilis. Field distributions correborate the laboratory data. L. peregra exhibited a drastic drop in heat tolerance during the egg laying phase. Desiccicating conditions seem to be more hazardous to L. peregra as it is physiologically less tolerant to the effects of drying and dies sooner than T. fluviatilis. However, the behavioural response to desiccation including rapid movements offers a chance of reaching water which is not open to T. fluviatilis. (Chilton-ORNL)
W76-12741

TOXICITY OF NATURAL PYRETHRINS AND FIVE PYRETHROIDS TO FISH,
Fish and Wildlife Service, La Crosse, Wis. Fish Pesticide Research Unit.
W. L. Mauck, L. E. Olson, and L. L. Marking.
Archives of Environmental Contamination and Toxicology, Vol. 4, 1976, p 18-29, 5 tab, 23 ref.

Descriptors: *Laboratory tests, *Toxicity, *Pesticides, Environmental effects, Fish, Temperature, Hydrogen ion concentration, Salmonids, Channel catfish, Yellow perch, Minnows, Trout, Water pollution effects.
Identifiers: *Pyrethrins, *Pyrethroids.

The toxicity of natural pyrethrins and five pyrethroids was determined with coho salmon, steelhead trout, fathead minnow, channel catfish, bluegill, and yellow perch. The order of toxicity of pyrethrum extract and pyrethroids from most toxic to least toxic based on active ingredient was found to be RU-11679, SBP-1382, pyrethrum extract, S-bioallethrin, dimethrin, and d-trans allethrin. All the compounds were more toxic to cold water species. Pyrethrum extract and four of the pyrethroids were more toxic in cold water with d-tran allethrin being more toxic in warm water. Pyrethrum extract was more toxic in pH 6.5 than in high pH water. Pyrethroids were not influenced by pH in the range of 6.5 - 9.5. RU-11679 and SBP-1382 were most rapidly deactivated. Toxicity of dimethrin and d-trans allethrin was least influenced by temperature, water hardness and pH. (Chilton-ORNL)

CHARACTERIZATION OF THE FACTORS RESPONSIBLE FOR DEATH OF FISH INFECTED WITH VIBRIO ANGUILLARUM,
Delaware Univ., Newark. Dept. of Biological Sciences.
T. H. Umbreit, and M. R. Tripp.
Canadian Journal of Microbiology, Vol. 21, No. 8, 1975, p 1272-1274, 3 tab, 11 ref.

Descriptors: *Bacteriology, *Biochemistry, Toxins, Fish, Bacteria, *Heat, Mortality, Cultures, Toxicity, Water pollution effects.
Identifiers: *Vibrio anguillarum.

Experimental goldfish were injected intraperitoneally with live bacteria (Vibrio anguillarum) in culture medium; heat killed bacteria; supernatant fluid; and heated supernatant fluid. Fish injected with 10 to the 9th power live bacteria died within 6 days. Vibrios were most abundant in gills, liver, intestinal tract, and coelomic fluid. Fish injected with dead bacteria showed almost identical mortality rates as did those fish injected with the cell free supernatant. It was concluded that Vibrio anguillarum produces substances toxic for goldfish that are released from live bacteria and associated with heat-killed bacteria. Heating (100 C) enhances the potency of the extracellular toxin. (Chilton-ORNL)

MECHANISM OF DEATH AT HIGH TEMPERATURES IN HELIX AND PATELLA,
Trinity Coll., Dublin (Ireland). Dept. of Zoology.
J. N. R. Grainger.
Journal of Thermal Biology, Vol. 1, 1975, p 11-13, 2 tab, 15 ref.

Descriptors: Physiology, *Mortality, *Mollusks, Temperature, *Thermal stress, Sodium, Potassium, Thermal pollution, Water pollution effects, *Respiration.
Identifiers: Tissue respiration, *Helix, *Patella, *Na/K ratio.

Results of respiration measurements on tissues from normal and heat dead animals showed the oxygen consumption to be steady with no decline after 40 min. A significant fall in blood Na and a significant rise in blood K was observed in heat dead Helix demonstrating a major disturbance in the Na/K ratio. A significant disturbance in the Na/K ratio was also seen in Patella but this was entirely due to a rise in blood Na. These disturbances are thought to be a prime cause of heat death. (Chilton-ORNL)

Marine Biology, Vol. 31, 1975, p 181-192, 1 tab, 32 ref.

Descriptors: *Ecology, *Environmental ef *Snails, *Latitudinal studies, Temperature, I tion, Aquatic populations, Density, abundance.

Identifiable factors that affect the life histo tributes of Tegula funebralis include lat population density as related to food supply ment and recruitment rate of young, and tion. This study was concerned with latitude an extent density. At higher latitude the s was found to live longer, grow more slowl attain a larger size than further south. Ag tribution was less predictable at higher lati These differences are explained by either perature effect together with increased haza planktonic larvae in the north or a combinat interactions between intensity of predation, lation density and food supply. Growth ra transplanted individuals suggested a genetic for the latitudinal differences. (Chilton-ORN W76-12751

THERMAL TRANSITIONS OF COLLAGEN FROM FISH RECOVERED FROM DIFFERENT DEPTHS,
Commonwealth Scientific and Industrial Research Organization, Sydney (Australia).
B. J. Rigby, and C. L. Prosser.
Comparative Biochemistry and Physiology, Vol. 52B, 1975, p 89-90, 2 tab, 7 ref.

Descriptors: Environmental effects, *Thermal stress, *Fish, Depth, Deep water, Shallow water, Temperature, Thermal pollution.
Identifiers: *Collagen.

Connective tissues which contain collagen as their main fibrous protein are known to exhibit thermal transition (due predominantly to the melting of molecular collagen) when heated. In dilute solution the collagen molecule undergoes a melting transition at a temperature which is characteristic of the species from which the collagen has been obtained. Melting temperature in acid of collagen from the skin of fish taken at 2000m depth with a habitat temperature of 2-4 C were 14 C; from flatfish taken at depths of 200m with a habitat temperature of 16-18 C were 25 C; and from reef fish with a habitat temperature of 24 C were 27 C. It was concluded that transition temperatures may correspond to lower and upper temperatures of the thermal preferendum. (Chilton-ORNL)

BEHAVIOR OF LOBSTERS (HOMARUS AMERICANUS) IN A SEMI-NATURAL ENVIRONMENT AT AMBIENT TEMPERATURES AND UNDER THERMAL STRESS,
Woods Hole Oceanographic Institution, Mass.
L. Stein, S. Jacobson, and J. Atema.
Report WHOI-75-48, October 1975, 49 p, 9 tab, 12 fig, 13 ref. AT(11-1) 3567 & E(11-1) 2546.

Descriptors: *Environmental effects, *Thermal stress, Laboratory tests, Behavior, *Lobsters, Temperature, Thermal pollution, Water pollution effects.

Identical semi-natural habitats in two 10 foot diameter, octagonal aquaria were established, each containing five lobsters. Behavioral observations were made during the day, following feeding and just after sunset (when lobsters are active under natural conditions) from February to August of 1974. Behavior patterns observed included shelter occupation, feeding, activity, and social behavior as exhibited by dominance, territoriality, mating, and aggression. Temperatures in the investigation ranged from 5 to 28 C. Patterns of residence and dominance in the lobsters changed seasonally. The direction of change was different in each tank and did not seem to be correlated with temperature. (Chilton-ORNL)

PERIPHYTON CROPS AND PRODUCTIVITY IN A REACTOR THERMAL EFFLUENT,
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
L. J. Tilly.
Report DP-MS-74-77, For presentation at the 38th Annual Meeting of the American Society of Limnology and Oceanography, held in Halifax, Nova Scotia, June 23-26, 1975. 21 p, 6 fig, 4 tab, 7 ref. CONF-750668-1. AT(07-2)-1.

Descriptors: *Environmental effects, *Thermal pollution, *Periphyton, Biomass, *Productivity, Standing crop, Temperature, Water quality, Photosynthesis, Ponds.

Periphyton samples on glass slides were placed at 7 locations in Par Pond (encompassing high-to-ambient temperatures and protected-to-open water conditions) for two weeks. The samples were examined for differences in species composition, diversity, standing crop, and C 14 uptake. For stations with average temperature differences of less than 5 C, weight specific productivity differed by a factor of 7. Periphyton biomass differed more than fivefold between stations 5.5 C apart. Weight specific productivity and accumulated crop correlated highly with average growing temperature, but slopes of regressions from consecutive periods often differed greatly while species composition and temperature regime changed only slightly. (Chilton-ORNL)

METABOLIC STUDIES ON THE AMPHIPOD ANISOGAMMARUS PUGETTENSIS IN RELATION TO ITS TROPHIC POSITION IN THE FOOD WEB OF YOUNG SALMONIDS,
British Columbia Univ., Vancouver. Inst. of Oceanography.
B. D. Chang, and T. R. Parsons.
Journal of the Fisheries Research Board of Canada, Vol. 32, No. 2, 1975, p 243-247, 2 fig, 2 tab, 16 ref.

Descriptors: Ecology, *Food webs, *Metabolism, *Amphipoda, Temperature, Salinity, Growth rates, *Life cycles, Habitats.
Identifiers: *Anisogammarus pugettensis.

The purpose was to study Anisogammarus pugettensis' life cycle, metabolism, and food requirements in relation to its habitat and to investigate its potential as an organism for food for young fish. It was concluded that the principal advantage to the mass cultivation of this organism as opposed to many pelagic species would be its ability to tolerate a wide range of temperatures and salinities and to survive upon different kinds of food. At a salinity of 28% and a temperature of 20 degrees C, it grew at a rate of 14% of body weight per day. Growth efficiency was between 19 and 34%. (Chilton-ORNL)

ANNULUS FORMATION AND GROWTH OF TIGERFISH, HYDROCYNUS VITTATUS, IN LAKE BANGWEULU, ZAMBIA,
Zambia Dept. of Fisheries, Samfya. Fishery Research Div.
J. S. Griffith.
Transactions of the American Fisheries Society, Vol. 104, No. 3, 1975, p 499-505, 3 tab, 4 fig, 12 ref.

Descriptors: *Environmental effects, *Temperature, *Aging(Biological), Fish, Growth rates, Growth stages, Lakes, Africa.
Identifiers: *Scale analysis, *Lake Bangweulu(Zambia).

The validity of scale analysis for aging tigerfish was assessed by examining the timing and cause of check formation on scales. Circuli which appeared to be valid annuli formed discontinuities on all scales under conditions of water temperature rising rapidly after a drop to 18 degrees C. The study does not indicate any other factors that could stimulate the formation of scale checks at the time these appeared. The lake level was dropping but did not reach a minimum until two to three months later and there was no indication that food availability decreased at the time of the check. (Chilton-ORNL)

THE EFFECTS OF POWER PLANT CONDENSER COOLING WATER ENTRAINMENT ON THE AMPHIPOD, GAMMARUS SP.,
New York Univ. Medical Center, N. Y. Lab. for Environmental Studies.
T. C. Ginn, W. T. Waller, and G. J. Lauer.
Water Research, Vol. 8, 1974, 937-945, 6 fig, 4 tab, 14 ref.

Descriptors: *Environmental effects, *Thermal pollution, Mortality, *Amphipoda, Entrainment, Cooling water, Powerplants, Temperature, Water pollution effects.
Identifiers: *Gammarus sp.

Mean per cent survival of Gammars sp. sampled during temperature rises of 7.1-8.3C at ambient temperatures of 24.9-26.0C was 98.5 and 97.4% for two intake stations and 90.1 and 96.8 for the two discharge stations. Increased initial and latent mortalities were observed during periods of condenser chlorination. Mean intake abundances were about an order of magnitude higher at night than during the day. Thermal tolerance of Gammarus sp. appeared to be dependent on exposure time and ambient temperature. Temperatures causing a 50% mortality for 30 min. exposure times increased about 11C as ambient temperatures increased 2.5 to 25.8C. (Chilton-ORNL)

THERMAL EFFECTS OF POWER PLANT ENTRAINMENT ON SURVIVAL OF FISH EGGS AND LARVAE: A LABORATORY ASSESSMENT,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel, T. S. Y. Koo, and C. F. Smith.
Chesapeake Bay Institute, Special Report 52, Reference 76-4, PPRP-13, 38 p, May 1976, 9 tab, 2 fig, 34 ref, append.

Descriptors: *Environmental effects, *Thermal pollution, *Fish eggs, Larvae, Temperature, *Entrainment, Resistance, Mortality, Laboratory tests, Freshwater fish, Striped bass, Herrings, Shad.

Blueback herring, American shad, and striped bass eggs and larvae were subjected to time-excess temperature histories typical of those experienced by organisms entrained by power plants with a variety of design and operating criteria. Excess temperatures ranged from 7-20C above base temperature, exposure time from 4-60 minutes, and cooling time from 60-300 minutes. Excess temperatures of 20C resulted in almost 100% mortality to eggs of all three species. Analyses of variance indicated that excess temperature exposures of 15C significantly reduced the hatching success of blueback herring and American shad eggs but not of striped bass eggs. Excess temperatures of 20C also caused almost 100% mortality of larvae in all three species. Striped bass larvae could withstand excess temperatures of up to 10C with no significant increase in mortality. (Chilton-ORNL)

ANALYSIS OF MULTIPLE CELL MECHANICAL DRAFT COOLING TOWERS,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
L. R. Davis.
Report EPA-660/3-75-039, June 1975, 38 p, 7 fig, 17 ref.

Descriptors: *Model studies, *Mathematical models, *Cooling towers, *Thermal pollution, Cooling water.

A mathematical model capable of calculating plume rise and dilution from multiple cell mechanical draft cooling towers with the wind normal to the tower line is presented. Calculation techniques are included for the zone of flow establishment, the zone of fully developed single plumes, the zone of merging multiple plumes and the zone of completely merged plumes. The entrainment functions presented include the effects of plume interference and variable entrainment surfaces on merging. Coefficients in the entrainment function must be determined from suitable field or laboratory data. The report version is for dry plumes but equations and modifications required to convert to moist plumes are included. (Chilton-ORNL)

EFFECT OF METEOROLOGICAL VARIABLES ON TEMPERATURE CHANGES IN FLOWING STREAMS,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
R. W. Troxler, Jr, and E. L. Thackston.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-240 285, $5.00 in paper copy, $3.00 in microfiche. Report EPA-660/3-75-002, January 1975, 83 p, 24 fig, 5 tab, 5 ref, 3 append. R-800613.

Descriptors: *Model studies, *Mathematical models, *Forecasting, *Water temperature, Streams, Meteorology, Water pollution effects.

A mathematical model to be used in predicting water temperature changes in a flowing stream as a function of stream geometry and weather information was developed and tested. Measurements were made on cold water from power station warmed moving downstream over periods of 38 hours. Data on which the/temperature ch were made were obtained from a boat floatin the water, a station on the bank and a re weather station 100 miles away. Difficultie countered in predictng stream temperature weather data from stations other than in the valley required modifications to account fo climatological differences between the two tions. It was concluded that highly acc weather predictions are difficult to obtain an predictions determined by the model can o as accurate as the weather data used for inpu model studied appears to be a useful tool. NATION OF ORGANICS IN DRINKING

l Environmental Research Lab., Cincin-
. Water Supply Research Div.
vens, C. J. Slocum, D. R. Seeger, and G.
k.

CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 85-114, 12 fig, 15 ref.

Descriptors: *Environmental effects, *Water pollution effects, *Potable water, *Water treatment, Water quality, *Chlorination, Organic compounds, Chemistry, Public health.

Trihalomethanes, potential health hazards, are formed during the chlorination step of the water treatment process. Some factors influencing trihalomethane production (precursor compound concentration, pH, type of disinfectant used, and temperature) are investigated. The precursor to trihalomethane is identified as a complex mixture of humic substances and simple low molecular weight compounds containing the acetyl moiety. The relative importance and contribution to trihalomethane production of each of the specific precursor compounds are pH dependent. The point of chlorination in the treatment process, being a significant factor in trihalomethane production, probably represents the most important variable to be considered for change in attempts to reduce ultimate trihalomethane concentrations in finished drinking water. HALOGENATED ORGANICS IN TAP WATER: A TOXICOLOGICAL EVALUATION,
Health Effects Research Lab. Cincinnati, Ohio.
R. G. Tardiff, G. P. Carlson, and V. Simmon.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 213-227, 7 tab, 18 ref.

Descriptors: *Environmental effects, *Toxicity, Chlorination, Organic compounds, Potable water, Public health, *Halogens, Chlorine.
Identifiers: Mutagenesis, Carcinogensis, Teratogenesis.

Surveys revealed that approximately 34% of the organic compounds found in drinking water are halogenated and that approximately 50% of the volatiles found in drinking water are halogenated. Assessment of these compounds requires consideration of degree of exposure, intrinsic toxicity of the agents, interactions among compounds and with other environmental factors, and species sensitivity. A program aimed at the toxicologic definition of the chlorinated hydrocarbons is described. Two approaches are taken; (a) that dealing with bioscreen of mixtures or organic compounds for mutagenesis, chronic toxicity/carcinogenesis, and teratogenesis; and (b) that dealing with specific chlorinated hydrocarbons or classes of these compounds, with specific emphasis on comparative metabolism for prediction of human responses and on interactions for predictions of synergism and antagonism. ORIGIN, CLASSIFICATION AND DISTRIBUTION OF CHEMICALS IN DRINKING WATER WITH AN ASSESSMENT OF THEIR CARCINOGENIC POTENTIAL,
National Cacer Inst., Bethesda, Md.
H. F. Kraybill.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held at Oak Ridge, Tennessee on October 22-24 1975. p 229-246, 5 tab, 42 ref.

Descriptors: *Environmental effects, *Public health, Chemicals, Potable water, Organic compounds, Chlorination, Distribution, Path of pollutants.
Identifiers: *Carcinogens.

Of the 235 chemicals in drinking water, 21 were characterized as having carcinogenic activity. Four of the chemicals listed are recognized carcinogens, the remaining are classified as suspect. Not all chemicals classified as having carcinogenic potential or activity can be assessed as to their equivalent hazard. Some chemicals may be characterized as potential carcinogens on the basis of structural relationships or ancillary studies on mutagenicity. The integrated insult from multiple carcinogens may have additive or inhibitory properties. The levels of the carcinogenic organics are in the parts-per-trillion and parts-per-billion range. THE POTENTIAL FOR INCREASED MUTAGENIC RISK TO THE HUMAN POPULATION DUE TO THE PRODUCTS OF WATER CHLORINATION,
Oak Ridge National Lab., Tenn.
R. B. Cumming.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 247-258, 2 tab, 11 ref.

Descriptors: Environmental effects, *Water treatment, *Chlorination, Potable water, Organic compounds, Chlorine, Public health, Laboratory tests.
Identifiers: *Mutagenesis.

A chemical (5-chlorourcil) which is known to be produced by water chlorination and to be present in drinking water was tested in several mammalian and submammalian genetic test systems. Data for incorporation studies into the DNA of mice together with specific-locus mutation data allow calculation of the upper 95% confidence limit for mutations induced in the human population at environmental exposure levels. This calculation demonstrates that the chemical in question does not, by itself, pose a significant genetic hazard to humans at current release levels. Data is not available on whether or not all of the chlorine-containing organic compounds produced by water chlorination pose a significant hazard. (See also W76-12876) (Chilton-ORNL)

THE EPIDEMIOLOGIC APPROACH TO THE EVALUATION OF WATER-BORNE CARCINOGENS,
National Cancer Inst., Bethesda, Md.
K. P. Cantor.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 259-274, 3 tab, 16 ref.

Descriptors: *Epidemiology, Water treatment, *Environmental effects, *Water pollution, Chemicals, Disease, Human diseases, Human populations, *Public Health.

Identifiers: *Carcinogens.

Epidemiologic studies are valuable because they are made directly on human populations making extrapolation from animal models and/or unrealistically high doses unnecessary in predicting effects on humans. Epidemiologic studies for cancer have limitations which include the long latent period for most cancers, difficulties in estimating dose, the definition of at-risk populations, and the relatively low exposure levels to carcinogens. The report lists a number of substances which have been identified as carcinogens (mustard gas, radiation, vinyl chloride monomer, B-Naphthylamine, benzidine, asbestos and smoking, asbestos, and cigarettes) and strongly linked to specific sites in the human body. So-called latent periods for most of the listed carcinogens are also indicated as well as the relative risk where it has been estimated. (See also W76-12876) (Chilton-ORNL)

THE TOXICITY OF CHLORINE TO FRESHWATER ORGANISMS UNDER VARYING ENVIRONMENTAL CONDITIONS,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
A. S. Brooks, and G. L. Seegert.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 277-298, 66 ref.

Descriptors: *Environmental effects, *Toxicity, *Chlorine, Aquatic life, Freshwater, Water pollution effects, Fish, Temperature, Water quality.
Identifiers: Exposure time, Dose rates.

Chlorine enters freshwater systems under a wide variety of environmental conditions including wide ranges of temperature, water quality, and variable application times and dose rates. The literature is reviewed in an attempt to evaluate the influence of these variables with respect to the toxicity of chlorine to freshwater organisms. It was concluded that the response of freshwater organisms to chlorine is species dependent and that the life stage and size of an organism is an important factor in the toxicity of chlorine. Exposure time and chlorine concentrations are critical in determining the final response of organisms. Temperature effects appear to be species dependent and also dependent on the specific temperature range concerned. The avoidance of chlorine by fish was demonstrated in the laboratory. INVESTIGATING THE EFFECTS OF CHLORINATED ORGANICS,
Oak Ridge National Lab., Tenn.
C. W. Gehrs, and G. R. Southworth.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 347-362, 2 fig, 2 tab, 12 ref.

Descriptors: *Environmental effects, *Water pollution effects, *Chlorination, *Organic compounds, Fish, Zooplankton, Carp, Daphnia, Mortality, Hatching, Mature growth stage.

Toxicity studies were conducted using the zooplankter Daphnia magna and the fish Cyprinus carpio. The parameters used were mortality and maturation in the zooplankter and hatching success (mortality) and malformation of fry for the fish. Two chlorinated compounds (5-chlorouracil and 4-chlororesorcinol) and a mixture of identified chlorinated organics were the chemicals tested. 5-chlorouracil caused no change in median survival times at concentration up to 1 mg/l. Both 4-chlororesorcinol and the synthetic mixture produced discernible changes in median survival times over the ranges tested. All concentrations of 4-chlororesorcinol and concentrations of 5-chlorouracil above 0.1 mg/l caused at least a 50% decrease in the number of young produced during the first seven days of free life in the zooplankter. Both 5-chlorouracil and 4-chlororesorcinol were found to have significantly lower hatching success of carp eggs at concentrations as low as 0.01 mg/l. The breakpoint of toxicity of the synthetic mixture was approximately 30 mg/l. A positive correlation has been seen between concentration of 5-chlorouracil and percent malformation in carp with a linear dose-response relationship originating at 0.5 mg/l. No similar response was found for either 4-chlororesorcinol or the synthetic mixture. (See also W76-12876) (Chilton-ORNL)

MODELING RESIDUAL CHLORINE LEVELS: CLOSED CYCLE COOLING SYSTEMS,
Industrial Environmental Research Lab., Cincinnati, Ohio.
G. R. Nelson.
CONF-751096, In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, held in Oak Ridge, Tennessee on October 22-24, 1975. p 365-385, 5 fig, 4 tab, 13 ref, 2 append.

Descriptors: *Model studies, *Mathematical models, *Chlorine, Cooling towers, Chlorination, Water pollution sources.
Identifiers: Residual chlorine, Chlorine levels, Blowdown.

The mathematical model discussed in this paper predicts residual chlorine levels in cooling tower blowdown streams at any time during the chlorination cycle. Program characteristics of the general model include split stream vs no split stream chlorination, residual data feedback vs no residual data feedback, and positive vs negative demand at the end of the chlorine feed period. Split stream refers to the fraction of the recirculating water chlorinated; residual data feedback to the type of chlorine feed equipment used; and positive or negative demand to the time length of the chlorine feed period. There are eight variations to the model which apply to specific chlorination program characteristics. (See also W76-12876) (Chilton-ORNL)

THE ECOLOGY OF ALGAE IN THE MORUYA RIVER, AUSTRALIA,
Bath Univ. (England).
I. C. Potter, D. Cannon, and J. W. Moore.
Hydrobiologia, Vol. 47, No. 3-4, p. 415-430, 1975. 6 fig, 3 tab, 24 ref.

Descriptors: *Australia, *Algae, Varieties, Succession, Dominant organisms, Herbivores, Seasonal, Standing crops, Benthic flora, Plankton, Diatoms, Chlorophyta, Scenedesmus, Lampreys, Ammocetes, *Ecology.
Identifiers: *Moruya River(Australia).

Studies of the Moruya River, Australia, indicated little scouring of the substrate. Turbidity and color were low and pH was slightly above neutral with no seasonal variation. Silicates were high. Calcium, nitrates, and silicates were seasonally static. Dissolved oxygen was always near saturation. Compared to northern hemisphere rivers, standing crops of benthic and planktonic algae were low. Diatoms always accounted for more than 90% of algae in sediments; the most common species were typical of holarctic flora. At all sampling sites, the relative abundance of the six predominant algal genera was similar. Gomphonema was more abundant downstream and Cocconeis placentula upstream. The largest standing crop was downstream in the calmest part of the river from January-March, coinciding with maximum wate temperatures. Downstream a true phytoplankton succession of filamentous chlorophytes, Scenedesmus, Melosira varians, Dactylococcopsis, Eudorina, and Merismopedia was observed in the spring and summer and a maximum standing crop in December. Guts of larval lampreys (larger than 100 mm) contained large numbers of algal cells. Scenedesmus and Dactylococcopsis were found more frequently in the guts than in sediment or water; however the reverse was true for filamentous algae. Ammocetes did not appear to significantly affect the algal standing crop. (Buchanan-Davidson--Wisconsin)

SIGNIFICANCE OF CELLULAR NITRATE CONTENT IN NATURAL POPULATIONS OF MARINE PHYTOPLANKTON GROWING IN SHIPBOARD CULTURES,
Centre Universitaire de Luminy, Marseille (France). Laboratoire d'Oceanographie.
Y. Collos, and G. Slawyk.
Marine Biology, Vol. 34, No. 1, p. 27-32, 1976. 1 fig., 3 tab., 32 ref.

Descriptors: *Nitrates, *Marine algae, *Metabolism, *Absorption, *Diurnal, Cultures, Denitrification, Sea water.
Identifiers: *Intracellular nitrate, Particulate nitrogen.

To study the significance of intracellular nitrate in controlling nitrate assimilation by marine phytoplankton and to understand relationships between nitrate uptake and reduction, phytoplankton intracellular nitrate concentrations were monitored in experiments on shipboard cultures of surface sea water from an upwelling region. Measurements were related to parameters of biomass (particulate nitrogen) and nitrate assimilation using nitrogen-15 isotope and nitrate reductase assays. Cellular nitrate was determined by filtering sea water, grinding in deionized water, centrifuging, and measuring nitrate in the supernatant in an autoanalyzer. Cellular nitrate concentrations exhibited diurnal variations (3.1-206 mg-at nitrate per microgram-at particulate nitrogen). These could be correlated positively with nitrate reductase activity. Nitrogen budgets indicated that nitrate reductase activity represented only 12% of nitrate incorporation in organic phytoplankton material when nitrate was present in sea water. When environmental nitrate was depleted (zero uptake), nitrate reductase activity completely accounted for internal nitrate decrease. Internal nitrate contents were better indices of nitrate consumption by marine phytoplankton than external nitrate-nitrogen concentrations, since no quantitative relationship was found between sea water nitrate and nitrate reductase activity. Diurnal variations in metabolism may be as important in phytoplankton competition and succession as temporal variations of environmental parameters. (Buchanan-Davidson--Wisconsin).

Descriptors: *Computer models, *Lakes, *Primary productivity, *Secondary productivity, Research and development, Rooted aquatic plants, Degradation(Decomposition), *New York, Predation, Crustaceans, Algae, Grazing, Zooplankton, Fish, Cycling nutrients.
Identifiers: *Lake George(NY), Model CLEAN, Model CLEANER.

Synthesis activities at the Lake George site during 1974-1975 are reviewed. Primary productivity modeling centered on development and implementation of a submodel to estimate rooted macrophyte productivity, which permitted input of data not previously accessible by the submodel WEED. To measure secondary productivity, a resource allocation-predation model was rebuilt, calibrated, and validated for herbivorous crustaceans. Selective grazing on natural algal assemblages by zooplankton was studied and a technique developed to examine size-selective grazing. The resource allocation-predation model permits assessment of effects of predator populations on zooplankton production in Lake George or other oligotrophic-mesotrophic lakes. The model suggests the importance of selective predation in regulating zooplankton production. Laboratory studies of selective feeding helped understand mechanisms of selective grazing. The glucose assimilatory activity of water columns and sediments was measured. Conversion factors were developed to give data collected during decomposition more ecological realism and make it more useful for models. Synthesis efforts resulted in validation, documentation, and evaluation of sensitivity of the models CLEAN and CLEANER. The model is valid for mesotrophic and eutrophic conditions, but is too sensitive to changes in certain parameters, so further modeling should focus on representation of adaptive shifts in environmental response. (Buchanan-Davidson--Wisconsin).

FLUCTUATIONS OF PHYTOPLANKTON BIOMASS AND ITS COMPOSITION IN A SUBARCTIC LAKE DURING SUMMER
Toronto Univ. (Ontario). Dept. of Botany.
R. G. Sheath, M. Munawar, and J. A. Hellebust.
Canada Journal of Botany, Vol. 53, p. 2240-2246, 2 fig., 1 tab., 22 ref.

Descriptors: *Fluctuations, *Phytoplankton, *Biomass, *Subarctic, *Lakes, Canada, Summer, Chlorophyta, Diatoms, Dominant organisms, Algae, Succession, Dinoflagellates, Varieties, Nannoplankton, Benthic flora, Chrysophyta.
Identifiers: Norman Wells(N.W.T.), Subarctic lakes.

Phytoplankton fluctuations, succession of algal taxa, net plankton and nannoplankton, and comparisons of phytoplankton and benthic algae were studied in a small subarctic lake located near Norman Wells, Northwest Territories, Canada. During the ice-free period, phytoplankton biomass increases were observed; peaks were observed early in July and late in August. Chlorophyta and Diatomaceae were dominant during periods of high biomass, this was not due to wind stirring of benthic forms. Other algal groups only showed relative increases during the minima. The early summer population was almost entirely diatoms, followed by mixed populations of diatoms and cryptomonads; Chlorophyta were dominant in midsummer; and then there were successive increases in chrysomonads, dinoflagellates, and finally diatoms. Fluctuations in major species were studied in relation to changes in algal group biomasses. Net plankton species were dominant (accounted for more than 50% of the total) most of the summer. Nannoplankters were only abundant for short periods from mid-June to July. Phytoplankton species composition in July was dissimilar to that of benthic algae since only 15% of the species were common to both habitats, and these species contributed to 23% of the estimated phytoplankton biomass. The source of common species is not known. (Buchanan-Davidson--Wisconsin).

AN AUTOMATED ASSAY FOR THE DETERMINATION OF NITRATE REDUCTASE IN MARINE PHYTOPLANKTON,
Centre Universitaire de Luminy, Marseille (France). Laboratoire d'Oceanographie.
G. Slawyk, and Y. Collos.
Marine Biology, Vol. 34, No. 1, p. 23-26, 1976. 5 fig., 13 ref.

Descriptors: *Denitrification, *Analytical techniques, *Marine algae, *Assay, Metabolism, Enzymes, Nitrites, Nitrates, Automation, *Bioassay, *Pollutant identification.
Identifiers: *Nitrate reductase.

An automated assay was developed to determine nitrate reductase activity in marine phytoplankton. This enzyme can be used as an index of the rate of nitrate-nitrogen assimilation in phytoplankton. The enzymes were extracted manually with phosphate buffer from cells in seawater, but the successive steps of substrate addition, incubation, stopping of the reaction, adding of reagents for nitrate measurement, and absorbance reading were done automatically using a Technicon AutoAnalyzer. This was compared with a manual method, using samples from the euphotic zone and shipboard cultures. Results obtained with the two methods were in good agreement; a correlation coefficient of 0.96 was calculated from the data. The automated method can handle up to twenty samples an hour, thus helping to overcome the difficulty of making frequent observations when studying diurnal variations of phytoplankton metabolic activities. It permitted the simultaneous handling of other measurements when enzyme extraction was completed. Results should also be more reproducible. Nitrate reductase activity and changes in nutrient concentrations, biomass, and assimilation rates were measured over a 14-hour period in shipboard cultures and in diatom batch cultures. (Buchanan-Davidson--Wisconsin).

THE INFLUENCE OF GIBBERELLIC ACID AND KINETIN ON THE GROWTH OF SCENEDESMUS QUADRICAUDA (TURP.) BREB.,
Wroclaw Univ. (Poland). Dept. of Experimental Botany.
J. Buczek, G. Kubik-Dobosz, and E. Tatkowska.
Acta Societatis Botanicorum Poloniae, Vol. 44, No. 3, p 415-421, 1975. 3 tab, 12 ref.

Descriptors: *Algae, *Scenedesmus, *Growth rates, Proteins, Cultures, Biomass.
Identifiers: *Harmones, *Gibberellic acid, *Kinetin.

The influence of gibberellic acid and kinetin (6-furfurylamino purine) on Scenedesmus quadricauda growth was studied. Gibberellic acid (0.0000001 M) significantly increased algal dry weight after 6 and 12 days growth, but not after 18 days; it had no effect on protein content; and increased the number of cells after 6 and 12 days, but not after 18 days. Kinetin (0.000001 and 0.0000001 M) increased dry weight about 22% after 12 days, and increased the protein content, especially during the initial phase of algal growth. Kinetin (0.000001 M) increased cell multiplication on all days by more than 30% and caused significant increases in cell division rates throughout the culture period. The lower kinetin concentration enhanced cell division after 12 days culture and prolonged intensive algal growth. The presence of these substances was not necessary for Scenedesmus growth. Gibberellic acid only stimulated cell multiplication and dry weight during the intensive growth phase; after that stage the mass and quantity of cells were the same as controls. Kinetin only affected cell division during the initial growth stage; affected dry weight after 12 days; and prolonged the ability of the cells to divide, thus extending the intensive growth phase. EFFECT OF ENVIRONMENTAL FACTORS ON PHOTOSYNTHESIS PATTERNS IN PHAEODACTYLUM TRICORNUTUM (BACILLARIOPHYCEAE). I. EFFECT OF NITROGEN DEFICIENCY AND LIGHT INTENSITY,
University Coll. London (England).
H. Glover, J. Beardall, and I. Morris.
Journal of Phycology, Vol. 11, No. 4, p 424-429, 1975. 1 fig, 7 tab, 16 ref.

Descriptors: *Biochemistry, *Marine algae, *Photosynthesis, *Diatoms, *Carbon, *Nitrogen, *Light intensity, Absorption, Deficient elements, Measurement, Amino acids, Carbon dioxide, Environmental effects.
Identifiers: *Phaeodactylum tricornutum, Carbon fixation.

During short-term carbon-14-carbon dioxide photoassimilation in cultures of the marine diatom Phaeodactylum tricornutum, much of the total fixed carbon was incorporated into amino acids and amides. Increasing nitrogen limitation in a nitrogen-limited chemostat affected radioactivity distribution in individual compounds but had no significant effect on the proportion of carbon incorporated into amino acids and amides together. Increased nitrogen deficiency reduced the proportion incorporated into amides, reduced the proportion of alanine, increased the amount of glutamic acid, increased the proportion of carbon assimilated into tricarboxylic acid cycle intermediates and decreased the relative synthesis of sugar phosphates. Reduced light intensities did not significantly affect the proportion of carbon incorporated into total amino acids and amides, decreased the radioactivity assimilated into glycine and serine and increased that assimilated into alanine. It is possible that the incubation was too long and the products were secondary products or that carboxylation of C-3-compounds to C-4-carboxylic acids of the tricarboxylic acid cycle was more important in Phaeodactylum than other algae. The significance of the facts that reduced light intensities and increased nitrate deficiency did not change the relative carbon incorporation into combined amino acids and amides but caused changes in the relative importance of certain compounds is discussed. CHRISTIAN U. OF L. URBANA CHAMPAIGN

odel of C-14 activity in algal cells during
d incubations was developed using basic
ic theory and taking dose rate and recycling
espiration into account. The model suggests
hort experiments may estimate gross produc-
ate, but long incubation times should not esti-
net production rate. An alternative estima-
procedure, involving several measurements of
of net uptake and using an estimate of algal
n content, is proposed to estimate both gross
et production rates. If net production is low,
rocedure can also be used to estimate algal
ass. The method depends on relatively high
ration to biomass ratios. When the method
ested in the laboratory using algal cultures
constant light and temperature, a clear ex-
ntial trend was observed as predicted by the
l and there was no change in rate of approach
uilibrium with increased dose rate. Biomass
ates compared favorably with direct esti-
from cell counts. The method appeared to
but field tests are necessary. Diurnal varia-
in the transport rate constants may make a
complex model necessary, but the same
kinetic principles will still apply. (Buchanan-
son--Wisconsin)

Descriptors: *Copepods, *Plankton, Aquatic animals, *Reproduction, Neritic, Variability, Productivity, Sampling.
Identifiers: Banyuls-Sur-Mer, France, Hensen nets, *Neritic zone.

The cycles of numerical variation of planktonic copepods sampled with 2 Hensen nets of different mesh size (0.330 and 0.160 mm) are very similar although the feeding capacity of one is much higher than that of the other. Total numbers follow a cycle characterized by the alternation of distinct minima and maxima which result from the successions of generations of dominating species. Periods of abundance correspond to the following months: Jan.-Feb., March-April, May-June, Sept.-Oct. The minima occur in Aug. and Dec. The amplitude of the mean quantitative annual variation varies from 18.500 (or 930/m3) to 142,400 (or 7120/m3) copepods/haul (i.e., 0.41 m2 surface) in the neritic province.--Copyright 1976, Biological Abstracts, Inc.

STUDIES ON A PURIFIED DIET OF PRAWN: IV. EVALUATION OF PROTEIN, FREE AMINO ACIDS AND THEIR MIXTURE AS NITROGEN SOURCE, (IN JAPANESE),
Kagoshima Prefecture Fisheries Experimental Station (Japan).
Deshimaru, Kuroki, Katsunobu, and Osamu.
Bull Jpn Soc Sci Fish. 41(1), p 101-104, 1975.

Descriptors: *Amino acids, *Nitrogen, *Proteins, Fish diets, Growth rates, Mortality, Water pollution effects.
Identifiers: Penaeus-Japonicus, *Prawns.

Prawns, Penaeus japonicus, were kept on purified test diets, which contained caseinalbumin (10:1), amino acids and their mixture as a N source for 4 wk. The level of the N source was 50, 37.5 and 25% for the protein and amino acid test diet, and 50% for diets containing a mixture of protein and amino acids. The best growth was obtained with the diet containing protein at a 50% level, followed by diets containing protein at 37.5% and 25% levels. The diets containing only amino acids brought about a very poor growth, low feed intake and high mortality, regardless of their levels in diets. Increase in the rate of protein to amino acids in the N source improved growth and feed intake and lowered mortality, suggesting that free amino acids are far inferior to proteinas N source for prawn. NORTH CAROLINA MARINE ALGAE. VI. SOME CERAMIALES (RHODOPHYTA), INCLUDING A NEW SPECIES OF DIPTEROSIPHONIA,
Duke Univ., Durham, N.C. Dept. of Botany.
C. W. Schneider.
Journal of Phycology, Vol 11, No 4, p 391-396, 1975. 7 fig, 19 ref. NSF GB-17545, CB-27725, CG-00005.

Descriptors: *North Carolina, *Marine algae, *Rhodophyta, Temperate, Speciation, Distribution, Systematics, *Diptera, Bays.
Identifiers: *Ceramiales, Delesseriaceae, Dasyaceae, Rhodomelaceae, Acrosorium uncinatum, Mesothamnion boergeseni, Rhododictyon bermudensis, Dasya ocellata, Dasyopsis spinuligera, *Dipterosiphonia reversa, *Onslow Bay(NC).

Previous studies of the offshore benthic algae in Onslow Bay, North Carolina, recorded as new fifteen taxa of Ceramiales, including three new species. An additional six Ceramiales have now been found in this area for the first time: Delesseriaceae--Acrosorium uncinatum; Ceramiaceae--Mesothamnion boergeseni and Rhodocictyon bermudensis; Dasyaceae--Dasya ocellata and Dasyopsis spinuligera; and Rhodomelaceae--Dipterosiphonia reversa. Acrosorium uncinatum and Rhododictyon bermudensis were also reported from South Carolina for the first time. In addition to the endemic Dipterosiphonia reversa, the other species have been known previously in tropical or subtropical waters. Acrosorium uncinatum and Dasya ocellata have frequently been reported in warm seas, but their range also extends into cool temperate waters. Previously Mesothamnion boergeseni was only known in Brazil. Dipterosiphonia reversa is added to algal literature for the first time. Evidence is also given for reassignment of Rhododictyon bermudensis from Dasyaceae to Ceramiaceae. Descriptions are presented for each, along with its known distribution, and locations of the places where it has been collected. (See also W75-10087 and W74-03885) (Buchanan-Davidson--Wisconsin)

Identifiers: *Hyco Lake(NC).

Between May 1966 and December 1974, four phases of thermal loading from three steam-electric generators have resulted in higher temperatures and increased evaporation from Hyco Lake, a 4,350 acre reservoir in north-central North Carolina. Average thermal loads during phases 1-4 were, respectively, 1.1, 2.6, 2.9, and 3.9 trillion British thermal units per month. Average monthly surface temperature increases during phases 1-4 were 2.4, 5.1, 5.0, and 5.8 degrees Fahrenheit, while average monthly forced evaporation was 2.9, 8.0, 8.4, and 9.9 cubic feet per second, respectively. These values compare with an average annual natural lake surface temperature of 62.5 degrees Fahrenheit and average annual natural evaporation of 37 inches or 18.4 cubic feet per second (Woodard-USGS)

CHANGES IN THE REACTIVITY OF THE PHOTOSYNTHETIC APPARATUS IN HETEROTROPHIC AGEING CULTURES OF SCENEDESMUS OBLIQUUS. I. CHANGES IN THE PHOTOCHEMICAL ACTIVITIES,
Marburg Univ. (West Germany). Botanisches Institut.
G. Kulandaivelu, and H. Senger.
Physiologia Plantarum, Vol. 36, No. 2, p 157-164, 1976. 10 fig, 1 tab, 21 ref.

Descriptors: *Inhibition, *Photosynthesis, *Aging(Biological), *Algae, *Plant physiology, *Scenedesmus, Cultures, Biochemistry, Kinetics, Fluorescence, Pollutant identification.
Identifiers: *Photochemical activity.

Changes in photosynthetic electron transport reactions in heterotrophic cells aging under the nutrient deficient conditions were studied. When the eucaryotic, unicellular green alga, Scenedesmus obliquus, was grown heterotrophically for 10 and 30 days without the addition of fresh media, there was an 85% and 98% loss in photosynthetic capacity, respectively, and an increase in quantum requirement. No changes in pigment amounts and types could be found that would explain the decay in photosynthetic capacity. Partial reactions mediated by photosystems I and II showed a more or less constant decay period over a 30-day period. Photosystem II reactions were less stable (decaying by 95%) than photosystem I reactions (decaying by 70%) over the 30-day period. Comparative studies of the potential of aged cells for cytochrome f photooxidation, fluorescence kinetics, 520 nm absorbance changes and the variable influence of 3-(3,4-dichlorophenyl)-1,1-dimethylurea and 2,5-dibromo-3-methyl-6-isopropyl-p-benzoquinone on the photosynthetic capacity of aged cells suggested that cells have the inherent ability to photooxidize plastohydroquinone (which is primarily affected). Secondary changes were also observed in the activity of reactions on the water-splitting side of photosystem II and in the P700-plasto-cyanin-cytochrome f complex. CHANGES IN THE REACTIVITY OF THE PHOTOSYNTHETIC APPARATUS IN HETEROTOPHIC AGEING CULTURES OF SCENEDESMUS OBLIQUUS. II. CHANGES IN ULTRASTRUCTURE AND PIGMENT COMPOSITION,
Marburg Univ. (West Germany). Botanisches Institut.
G. Kulandaivelu, and H. Senger.
Physiologia Plantarum, Vol. 36, No. 2, p 165-168, 1976. 5 fig, 18 ref.

Descriptors: *Plant physiology, *Aging(Biological), *Cytological studies, *Photosynthesis, Cultures, *Scenedesmus, *Pigments, Chlorophyll, Respiration, Pollutant identification, Electro microscopy.
Identifiers: Chloroplasts, Thylakoid membranes.

Ultrastructural changes in chloroplasts which accompany loss of photosynthetic activity during ageing of heterotrophic Scenedesmus cells were studied by electron microscopy. Chloroplasts of actively dividing cells contained many starch grains surrounded by condensed thylakoid membrane layers. Starch grains gradually disappeared and more definite chloroplast structures formed. Later the cytoplasm became less structured and more granular; large vacuoles engulfed many organelles; and chloroplasts became more prominent. Photodensitometric analysis showed that thylakoids were very thin in dividing cells; stacking of membranes was observed during initial aging; and thickness had increased 30% by 30 days. Total chlorophyll increased on the basis of culture volume and somewhat on the basis of cell numbers for 5 days, then remained constant. Initially the chlorophyll a/b ratio decreased rapidly. Most mitochondria degenerated and were engulfed by vacuoles. Endogenous respiration decreased slowly during aging. Prolonged growth under heterotrophic conditions caused rapid loss of photosynthetic capacity but no observable disintegration of membrane structures. Results indicated the presence of an intact pigment system, even in aged cells, and that the loss of photosynthetic capacity is largely due to partial inactivation of the reoxidation capacity of the plastoquinone, the cytochrome f-plastocyanin-P700 complex, and the water oxidizing enzymatic reaction. G. Kulandaivelu, and H. Senger.
Physiologia Plantarum, Vol. 36, No. 2, p. 169-173, 1976. 7 fig., 11 ref.

Descriptors: *Algae, *Photosynthesis, *Plant physiology, *Scenedesmus, Cultures, *Aging(Biological), Light intensity, Magnesium, Manganese, Chlorophyll, Kinetics, Pollutant identification.
Identifiers: Photooxidation, Electron transport.

When dark grown Scenedesmus obliquus cultures aged 2 to 30 days were transferred into light for two hours, photosynthetic capacity reactivated 1.5 to 80 fold. During reactivation, cell numbers in packed cell volume did not increase. The react tion rate was faster when magnesium and m ganese ions were added, but addition of only f medium to aged cultures in the dark had little fect on photosynthetic rate. Cell growth and division were not observed during reactiva Light-dependent reactivation showed biph (initial rapid and second slow) increases in 2 t day-old cultures. The initial phase might be du rapid reactivation by magnesium and manga ions and the second phase to activation of pre synthetic mechanism. The action spectrum o reactivation process had the same absorp spectrum as chlorophyll in vivo, indicating reaction's energy dependence on photosynth Kinetics of cytochrome f photooxidation, 52 absorbance changes, and fluorescence indu showed that immediate recovery photosynthetic capacity was largely du reestablishment of a balanced electron tran system. Light periods of 30 to 60 minutes enough to reestablish efficient coupling bet the two photosystems. No increase in cytochrome f pool level (measured by lig duced absorption change) was observed durin reactivation period. (See also W76-13109 and 13110) (Buchanan-Davidson--Wisconsin)

Identifiers: *Sodium sulfite, Keratella cochl Cyclops bicuspidatus thomasi.

Effects of chlorinated effluents from the Island Sewage Treatment Plant on invertebra the Milwaukee Harbor and adjacent Michigan were studied. Benthic organisms pe tions were reduced by the effluent plume. surable chlorine residuals were confined to small area around the effluent. The rotifer Ke la cochlearis and copepod Cyclops bicusp thomasi were very sensitive to chlorine resi Sodium sulfite is an efficient inexpensive ch for reducing chlorine residuals. It is not to Cyclops or Keratella at levels which r chlorine residuals in sewage, and reduces re chlorine toxicity effectively without produci desirable by-products. Complete reductio curres in less than 20 seconds. Chlorine ap tion rates to sewage should be regulated in of chlorine demand of the sewage and rec waters to minimize chlorine residuals in t fluent plume. To protect sensitive species residual chlorine levels should not exceed mg/l when applied continously. Chlorine res should be reduced by sodium sulfite when re cannot be maintained within acceptable limi where a continuously chlorinated effluent adversely affect aquatic organisms. Studies be made to determine if other chlorinated pr are present which may not be detectal residual chlorine yet are toxic. (Buchanan-l son--Wisconsin)

LE EFFECT OF LOWER PHOSPHORUS NTRATIONS ON THE PHYTOPLANK-N ONONDAGA LAKE, NEW YORK,
niv. of New York at Buffalo. Dept. of

gia, Vol. 14, No. 4, p. 197-204, 1975. 4 fig., 3 ref. FWQA 11060 FAW.

ors: *Environmental effects, orus, *Succession, *Phytoplankon, *New utrophication, Nutrient removal, Lakes, Monitoring, Water pollution, yta, Chlorophyta, Diatoms, Silica, Water pollution effects.
rs: *Onondaga Lake(NY), Phosphorus

a Lake, one of the most polluted lakes in rk, receives municipal wastes from the area and industrial wastes containing al and chloride concentrations. These, ral salt springs, give the lake a high saline Lake conditions were studied in 1969 and een monitored since. Banning of us-containing detergents in 1971-1972 pproximately a 50% reduction in inor-osphorus in Onondaga Lake. Disap-of blue-green algae from summer plank-ning in 1972 appeared related to changes orus concentration. Before 1972, flagel-diatoms were common in the spring; dur-mmer, green and blue-green algae were dominant; enough nitrogen and phosphorus were present to support the observed phytoplankton growth; and silica was depleted during diatom blooms. From 1972-1974, green algae were present in large numbers throughout the summer, and blue-green algae were absent or rare. This absence of blue-green algae probably did not result from direct growth limitation by low phosphorus levels. Reduction of pollutants entering the lake is expected to change the relative importance of phytoplankton populations without a decline in overall biomass. More changes in phytoplankton are expected when tertiary treatment of wastes entering the lake begins. (Buchanan-Davidson--Wisconsin)

LIGHT/DARK-PHASED CELL DIVISION IN EUGLENA GRACILIS (Z) (EUGLENOPHYCEAE) IN PO4-LIMITED CONTINUOUS CULTURE,
New York State Univ at Albany. Dept. of Biological Sciences.
S. W. Chisholm, R. G. Stross, and P. A. Nobbs.
Journal of Phycology, Vol. 11, No. 4, p. 367-373, 1975. 7 fig., 35 ref. NSF GV 29347 and AG-199, 40-193-69.

Descriptors: *Euglena, *Limiting factors, Biorhythms, Phosphates, *Cytological studies, *Cultures, Growth rates, Laboratory tests, Phosphorus, Euglena, *Euglenophyta.
Identifiers: *Euglena gracilis, Chemostats, Cyclostats.

Euglena gracilis cell density patterns and growth dynamics were studied in a light/dark entrained, phosphorus-limited chemostat (called cyclostats). Cell division was restricted to dark periods regardless of the number of cells dividing in each 24 hour period. Growth rate (amplitudes of cell density oscillation) was correlated with dilution rates. Division gate width, analyzed with a phasing index, was narrowest at dilution rates where the mean generation time of the cell population was an even multiple of 24 hours. This was due to enhanced phasing of the cell division process by the biological clock of Euglena. At all submaximal growth rates, residual phosphate levels in the cyclostat were below 0.3 micromoles phosphate. Cellular phosphorus concentrations increased with dilution rates as described by a hyperbola saturating at a maximum dilution rate of 0.74 per day with 8 x 10 to the 8th power micromoles phosphorus/cell as the minimum intracellular phosphorus concentration for growth. Similarities and differences between chemostats and cyclostats are discussed. Because the light/dark cycle is a strong natural selective force, cyclostats represent an improvement over the chemostat. A major difference is that dilution rate cannot be equated to growth rate, except when averaged over 24 hours thus gaining ecological relevance. (Buchanan-Davidson--Wisconin)
W76-13117

DIATOM COMMUNITIES FROM A DELAWARE SALT MARSH,
Delaware Univ., Newark. Dept. of Biological Sciences.
M. J. Sullivan.
Journal of Phycology, Vol. 11, No. 4, p. 384-390, 1975. 5 tab., 13 ref.

Descriptors: *Soil algae, *Diatoms, *Biological communities, *Salt marshes, *Delaware, Varieties, Ecological distribution, Habitats, Dominant organisms, Vegetation.
Identifiers: *Canary Creek(Del).

The taxonomic composition of edaphic diatom communities from five representative habitats of the Canary Creek salt marsh, Lewes, Delaware, was studied. Of 104 diatom taxa, 32 were distributed throughout the marsh and 41 were endemic to only one habitat. Three habitats supported grass standa (tall Spartin alterniflora, dwarf S. alterniflora, and Distichlis spicata) which covered 90% of the marsh surface. These habitats had the highest species diversity and greatest numbers of diatom species. The grassy cover prevented exposure to hypersaline conditions for prolonged periods and influenced temperature, which affected diatom reproduction rates. Bare bank and panne habitats were devoid of macroscopic vegetation and their diatom populations were exposed to hypersaline conditions in warmer seasons. Each habitat supported its own unique, edaphic diatom community. Community differences were related to temperature and elevation differences and interactions between edaphic diatoms and filamentous algae. Species diversity and species numbers were greatest for edaphic communities associated with dwarf S. alterniflora and D. spicata habitats, lowest for panne, and intermediate for bare bank and tall S. alterniflora habitats. Similarity index comparisons of community structure described the similarities or dissimilarities of two communities more adequately than comparisons of species diversity. The communities showed a high degree of dissimilarity. (Buchanan-Davidson--Wisconsin)

REGULATION OF NITRATE ASSIMILATION BY AMINO ACIDS IN CHLORELLA,
Karachi Univ. (Pakistan). Dept. of Botany.
Z. Abdullah, and J. Ahmed.
Plant and Cell Physiology, Vol. 16, No. 6, p. 971-974, 1975. 6 tab., 15 ref.

Descriptors: *Plant physiology, *Nitrogen fixation, *Amino acids, *Inhibition, Chlorella, Algae, Respiration, Metabolism, Enzymes, Denitrification, Ammonia, *Absorption, *Chlorophyta.
Identifiers: *Chlorella fusca.

Control of nitrate assimilation by exogenous amino acid supplies to the medium was studied in the green alga Chlorella fusca. Methionine, proline, valine, threonine, histidine, and glutamic acid inhibited nitrate assimilation. Alanine, tryptophan, arginine, lysine, leucine, and aspartic acid did not. Inhibition of nitrate assimilation was due to inhibition or repression of nitrate reductase. Complete destruction of reductase activity by methionine, proline, and valine indicated that nitrate reductase was both repressed and inactivated. Inhibition was reversed by non-repressors. Both amino acid classes interacted but no non-repressor amino acids behaved as universal derepressors. Leucine derepressed all repressors except glutamic acid; aspartic acid derepressed all repressors but not in the presence of threonine. Amino acids which inhibit nitrate assimilation may inhibit nitrate entry into cells. Methionine, proline, valine, histidine, and glutamic acid repressed nitrate reductase in Chlorella and cultured tobacco cells; alanine, asparagine, and leucine were non-repressors in Chlorella but repressors in tobacco. Non-repressors were not all derepressors; some repressor pairs were non-repressive, but pairs of methionine, proline, and valine were always repressive. (Buchanan-Davidson--Wisconsin)

FIELD DETERMINATION OF THE CRITICAL NUTRIENT CONCENTRATIONS FOR CLADOPHORA IN STREAMS,
Ontario Ministry of the Environmet, Rexdale. Limnology and Toxicity Section.
S. L. Wong, and B. Clark.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 1, p. 85-92, 1976. 4 fig., 1 tab., 19 ref.

Descriptors: *On-site-tests, *Nutrient requirements, *Cladophora, *Streams, *Canada, Aquatic weeds, Phosphorus, Plant tissues, Productivity, Aquatic weed control.
Identifiers: *Phosphorus load, North Thames River(Ontario), Avon River(Ontario), Middle

Maitland River(Ontario), Bayfield River(Ontario), Nith River(Ontaro), Conestogo River(Ontario).

Because many streams in southern Ontario have excessive seasonal growths of aquatic plants such as Cladophora and Potamogeton, critical phosphorus and nitrogen concentrations for Cladophora were determined in six rivers. A direct relationship between ambient phosphorus concentrations in water and phosphorus concentrations in plant tissue with a regression coefficient of 0.87 was observed. Determination of actual phosphorus concentrations below which the specific Cladophora growth rate was reduced was hard to determine, especially under field conditions; it is approximately 1.6 mg phosphorus/g dry wt in tissue and 0.06 mg/l in water. No significant correlation was observed between the nitrogen content of plant tissue and that of water. Correlation of total phosphorus with plant growth can be used to estimate the waste load which would cause maximum growth of Cladophora. However this does not have any predictive value with respect to total biomass or dissolved oxygen fluctuations. Because plant tissue phosphorus content is less affected by daily fluctuations in ambient phosphorus concentration, it can be used to predict the average ambient nutrient concentration in a river reach over a period of time with fewer samples. (Buchanan-Davidson--Wisconsin)

AN ATTEMPT TO EVALUATE THE STATE OF HEALTH OF FISH FROM THE LYNA AND WALSZA RIVERS IN CONNECTION TO THEIR POLLUTION, (IN POLISH),
H. Dabrowska.
Przegl Zool. 18(3), p 390-395, 1974.

Descriptors: Water pollution effects, *Fish diseases, Europe, *Fish parasites, *Waste disposal, Outfall sewer, Outlets, Organoleptic properties, Perches, Pikes, Rivers, Trematodes.
Identifiers: Acanthocephalus-Sp, Chondrostoma-Nasus, Chub, Gudgeon, Orfe, Perch, *Poland, Roach, Rudd, Silver bream, Trichodina, Walsza River(Poland), Lyna River(Poland).

Parasitological, anatomo-histopathological and organoleptic studies of fish caught by an electric device above and below the outlet of wastes into the Lyna and Walsza Rivers (Poland) were carried out. From the Lyna River, pike, roach, perch, silver bream, orfe, rudd and chub were examined; Chondrostoma nasus, roach, chub and gudgeon were taken from the Walsza River. Parasites (21 spp.) were found; 14 on fish from the Lyna River and 8 on fish from the Walsza River. Most numerous were eye trematodes- 91.6% (Lyna) and 56.6% (Walsza), the Trichodina 79.1% (Lyna), and Acanthocephalus sp. 54.1% (Lyna). Intensity of parasite infection was much higher in both rivers in fish caught at polluted stations. Histological examination of gills showed that 70% of fish from the Lyna had necrobiotic changes of the epithelium and disorders in the gill circulation system. In fish caught at the clean station, gills were generally in good condition.--Copyright 1975, Biological Abstracts, Inc.

CHARACTERISTICS OF THE PRIMARY PRODUCTION IN THE SALMON BREEDING LAKE, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
Y. I. Sorokin, E. B. Pavel'eva, and M. I. Vasil'eva.
Zh Obshch Biol. 35(5), p 746-755, 1974.

Descriptors: *Primary productivity, *Lakes, *Biomass, *Algae, Eutrophication, Nutrients, Fertilization, Breeding, Water pollution effects, *Salmon.
Identifiers: Oncorhynchus-Nerka, Russian-SFSR, Lake Dalnee(USSR), Kamchatka.

During 2 seasons primary production was estimated in Lake Dalnee (Kamchatka) (Russian SFSR, USSR) the breeding place of Oncorhyncus nerka. Primary production in 1970 was 171; and in 1971, 147 gC/m2/yr. The average biomass of algae in water column was correspondingly 0.7 and 1.4 gC/m2. Primary production in the lake is still relatively high and is not seriously influenced by the decrease in nutrient income caused by the drop in the number of fish arriving for breeding, and so fertilizing it.--Copyright 1975, Biological Abstracts, Inc.

QUANTITATIVE DYNAMICS OF BACTERIA IN THE KREMENCHUG RESERVOIR, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
N. I. Sakharova, and L. G. Brantsevich.
Gidrobiol Zh. 10(4), p 94-96, 1974.

Descriptors: *Bacteria, Seasonal, Reservoir, Spatial distribution, Temporal distribution, *Distribution patterns, *Algae, Microorganisms, Benthos.
Identifiers: *Azotobacter-Like organisms, *Bacilli, *Cocci, Spores, Ukrainian-SSR, Dniepr River(USSR), *Kremenchug Reservoir(USSR).

The vertical, horizontal and seasonal distribution of bacilli, cocci, spores, azoto-bacter-like and other organisms was studied in the water and bottom deposits of the Kremenchug Reservoir on the Dniepr River (Ukrainian SSR, USSR). A comparative evaluation of the distribution of algae and bacteria of different morphological groups showed that neither the abundance of algae nor their physiological state affected the relationship of the morphological groups of bacteria in the aquatic biocenoses. In all cases bacilli predominated over cocci, and among the bacilli, the nonsporulating predominated. However, there was a direct and inverse relation between the number of algae and content of microorganisms in the water and bottom deposits, which was determined not only by the abundance of algae but also by their physiological state.--Copyright 1975, Biological Abstracts, Inc.

ZOOPLANKTON POPULATIONS IN THE 'WATER-SPORTBAAN GEORGES NACHEZ' AT GHENT IN 1972, A YEAR OF CONTINUOUS WATERBLOOMING, (IN FLEMISH),
Ghent Rijksuniversiteit (Belgium). Faculteit Landbouwwetenschappen.
J. De Maeseneer.
Natuurwet Tijdschr. 55(4-6), p 193-201, 1973.

Descriptors: *Zooplankton, *Eutrophication, *Sampling, Europe, Algae, Aquatic plants, Crustaceans, Daphnia.
Identifiers: Asplanchna, *Belgium(Ghent), Bosmina, Brachionus-Angularis, Brachionus-Calyciflorus, Filinia-Longiseta, Keratella-Cochlearis, Keratella-Quadrata, Phormidium-Sp, Polyarthra, Pompholyx-Sulcata, Stephanodis Sp.

Zooplankton populations in samples colle weekly in the 'Nationale Water-sportbaan Geo Nachez' at Ghent (Belgium) i 1972 were quit ferent from those in 1969. The latter year characterized by the absence of waterbloo during the former, extensive bloom Stephanodiscus sp. (early Spring) and Phormi sp. (rest of the year) developed. Cladoceran p lations (Bosmina and especially Daphnia) severely reduced in 1972. Nauplii also decrea 1972. Cyclopids, however, did not seem to b versely affected. With the exceptio Brachionus angularis and Polyarthra, popul of B. calyciflorus, Keratella cochlearis quadrata, Filinia longiseta, Asplanchna Pompholyx sulcata were higher in 1972. The regular presence of Polyarthra, F. longiseta a angularis in 1972 is also obvious as well a earlier appearance of P. sulcata. It is not k whether the influence of the waterbloom direct.--Copyright 1975, Biological Abstracts W76-13196

LONG-TERM CHANGES IN THE BEN BIOMASS OF THE KUIBYSHEV W STORAGE BASIN, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut B Vnutrennykh Vod.
S. M. Lyakhov.
Gidrobiol Zh. 10(4), p 21-23, 1974.

Descriptors: *Biomass, *Benthos, Water st Trophic level, River basins, Sediments, Mud
Identifiers: *Kuibyshev River basin(USSR).

For a long time, benthos on the flooded land Kuibyshev water storage basin (Russian USSR) was extremely poor because of unf ble trophic conditions. Recently (since 1966) mulation of mud sediments and a rise trophic level have resulted in a 5-7-fold incre the benthos biomass in this area with simult growth in the former Volga bed. The next s sional stage in the water storage basin benth stage of biotope leveling-will be very long.-- right 1975, Biological Abstracts, Inc.

INTER-RELATION OF KEY-FACTORS FOR INFILTRATION OF LIQUID DOMESTIC WASTE INTO SOIL,
Connecticut Univ., Storrs.
F. W. Kropf.
Available from University Microfilms, Inc., Ann Arbor, Mich., 48106, Order No. 76-10,274. Ph.D. Thesis, 1976, 84 p.

Descriptors: *Waste water treatment, *Infiltration, *Infiltration rates, *Waste disposal, *Effluents, Domestic wastes, Liquid wastes, Absorption, Septic tanks.
Identifiers: Land application, Septic tank effluents.

Soil disposal systems are frequently a valid alternative to aquatic disposal; their long term absorption capacity is controlled by either the hydraulic criterion or the infiltration criterion, which is the acceptance rate of the biological slime layer at the soil interface. Columns of three representative soils were flooded with septic tank effluent, either continuously, for 6 hours once a day, or for 12 half hour periods daily. Intermittent flooding was not advantageous for long term operation. The biological slime layer causing the clogging did not become completely impervious; the minimum infiltration rates were one to 2 cm/day. The effect of soil permeability on absorption rate was relatively small, provided the system was governed by the infiltration criterion. The infiltration interface orientation did not affect the infiltration rate. Continuous slime layer inundation did not adversely affect its capability to infiltrate liquid. Various design recommendations are outlined for fail-safe operation of small scale soil infiltration systems. (Snyder-FIRL)

SLUDGE PROCESSING, TRANSPORTATION AND DISPOSAL/RESOURCE RECOVERY: A PLANNING PERSPECTIVE,
Environmental Protection Agency, Washington, D.C. Div. of Water Planning.
J. M. Wayatt, and P. E. White, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 013, $7.75 in paper copy, $3.00 in microfiche. Report EPA-440/9-76-002, December 1975, 201 p, 61 tab, 21 fig, 121 ref, append. EPA No. 68-01-3104.

Descriptors: *Sewage treatment, *Alternative planning, Sludge treatment, Sludge disposal, Sanitary engineering, Cost-benefit analysis, Water pollution, Transportation, Waste disposal, *Waste treatment.

The purpose was to provide information to planning agencies regarding the sources, characteristics, treatment methods, transportation modes, and ultimate disposal processes for residual wastes generated in municipal wastewater treatment plants. Technical, economic, social, and institutional factors pertinent to the alternatives are considered. Handling and treatment processes were evaluated in light of qualitative and quantitative changes to the residual wastes. Environmental, operational and institutional constraints to the use of ocean disposal, lagoons, sanitary landfills, sludge recycling, and land reclamation were presented. (Chilton-ORNL)

Atlantic Richfield Hanford Co., Richland, Wash. Advanced Waste Engineering Dept.
Available from the National Technical Information Service, Springfield, VA 22161 as ARH-ST-132 A. $4.50 in paper copy, $3.00 in microfiche. Report ARH-ST-132 A, March 1976, 65 p, 9 tab, 8 fig, 5 ref. Kounts, J.S., Editor. E(45-1)-2130.

Descriptors: *Waste disposal, *Radioactive waste disposal, Engineering, Environmental engineering, Long-term planning.

A program for the development of technology for removal of waste from underground storage tanks, conversion of the waste to an improved stabilized form, and final storage of the imobilized waste in a location that does not require controlled management is reported on. A section on Storage System Integrity and Engineered Improvements establishes a data base and methodology for periodic evaluation of in-tank storage. The Immobilization and Storage section provides a summary of work associated with technology for the conversion of retrieved waste to an immobilized form satisfactory for final storage. Contaminated Equipment Volume Reduction section addresses the development and demonstration of methods for the reducing of radioactively contaminated metallic items to a size and form suitable for final storage or disposal. FEASIBILITY OF MICROBIAL DECOMPOSITION OF ORGANIC WASTES UNDER CONDITIONS IN DEEP WELLS,
Oklahoma State Univ., Stillwater. Dept. of Microbiology.
M. M. Grula, and E. A. Grula.
Available from the National Technical Information Service, Springfield, VA 22161 as BERC/RI-76/6, $4.50 in paper copy, $3.00 in microfiche. Report BERC/RI-76/6, March 1976, 57 p, 18 tab, 22 ref. HO 122120, Modification No. III.

Descriptors: *Waste treatment, *Biodegradation, *Microbial degradation, *Deep wells, Organic wastes, *Decomposing organic matter, Waste disposal.

The objective was to determine the feasibility of inoculation of the waste with bacteria which would decompose toxic substances underground through metabolic processes. Under aerobic conditions, temperature was not a constraint. Thermophilic bacteria decomposing a wide variety of compounds are readily obtained from ordinary soil. Mixed cultures were found to be more efficient biodegraders than pure cultures. High pressures inhibited biodegradation at high temperatures. All strains isolated grew well at 1000lb/sq. in. helium on a complex medium. Hyperbaric oxygen was toxic for all organisms tested. Attempts to derive modified strains with a higher growth temperature range than the parent strain failed. It was concluded that in situ biodegradation was not a reliable means of removing organic wastes in deep wells. (Chilton-ORNL)

INTERIM SOLIDIFICATION OF SRP WASTE WITH SILICA, BENTONITE, OR PHOSPHORIC ACID,
Du Pont de Nemours (E.I.) and Co., Aiken, S.C. Savannah River Lab.
G. H. Thompson.
Available from the National Technical Information Service, Springfield, VA 22161 as DP-1403, $3.50 in paper copy, $3.00 in microfiche. Report DP-1403, March 1976, 12 p, 1 fig, 2 tab, 12 ref. AT(07-2)-1.

Descriptors: *Radioactive waste disposal, *Alternative planning, Radioactive wastes, Storage, Chemistry, Separation techniques, South Carolina, Silica, Bentonite, Chemical reaction, *Waste treatment.
Identifiers: Savannah River Plant(SC), *Solidification(Nuclear wastes), Phosphoric acid.

Results of the study show that alkaline waste can be solidified by reaction with silica gel, silica flour, or sodium silicate solution. Alkaline supernate can be solidified by reaction with bentonite to form cancrinite powder. In both of these cases, the solidified wastes can be retrieved by slurrying with water. Alkaline supernate can be solidified by partial evaporation and reaction with phosphoric acid. Plant waste treated in this way would not solidify completely because of decay heat. Reaction of simulated alkaline waste solutions with all of these resulted in increased volume. The best method for in-tank solidification appeared to be by evaporation since this contributes no additional solids and did not compromise any waste management options. (Chilton-ORNL)

ACTIVATED CARBON TREATMENT OF PHENOLIC PAINT STRIPPING WASTEWATER,
Facet Enterprises Industries, Inc., Warwick, R.I.
A. E. Perrotti.
Report AFCEC-TR-75-14, August 1975. 131 p, 63 fig, 15 tab, 7 ref, 2 append. F08638-74-C-0005.

Descriptors: Engineering, *Water pollution, *Waste water treatment, Civil engineering, Chemical engineering, On-site laboratories, Industrial wastes, Phenols, Water pollution sources, Paints, *Activated carbon.

This study was conducted to ascertain the economical and technical practicality of using a granular carbon system for treating large volumes of phenol bearing wastewater from the depainting of aircraft and related equipment. Laboratory investigations characterized the waste water and evaluated different activated carbons for its treatment. A pilot plant was then set up at Kelly Air Force Base for treatment of phenol wastewater. In the pilot plant operation, carbon was exhausted five times and thermally regenerated four times. The pilot plant was operated intermittently for a period of six months. It was concluded that activated carbon was a viable treatment method for the removal of phenol and it was recommended that a full scale system be installed with a capacity of 50 gallons per minute flow. MEADOW/MARSH SYSTEMS AS SEWAGE TREATMENT PLANTS,
Brookhaven National Lab., Upton, N. Y.
M. M. Small.
Report BNL 20757, November 1975, 37 p, 6 fig, 2 tab, 22 ref.

Descriptors: *Sewage treatment, *Waste water treatment, *Cost analysis, Ponds, Marshes, Grasslands, *Treatment facilities, New York, Groundwater, Water reuse.
Identifiers: *Long Island(NY).

The two sewage treatment systems reported upon are both closed, natural systems which produce no objectionable odors, no excess of flies or mosquitoes and release a minimum of airborne mists. Each system processes 10,000 gallons of domestic sewage per day and returns drinkable water to Long Island's ground water supply. Neither produces any sludge for further disposal. The two systems are called Meadow/Marsh/Pond (M/M/P) and the Marsh/Pond(M/P) systems. On the basis of investigations to date both systems can be recommended for use as sewage treatment plants, water producers and farms for sewage loads between 10,000 and 1,000,000 gallons per day. The M/P requires one half as much land and so has a lower first cost but it does not offer an upland crop for harvest and resale as does the M/M/P and for that reason may not be less expensive to operate. (Chilton-ORNL)

ACID DIGESTION OF COMBUSTIBL WASTES: A STATUS REPORT,
Hanford Engineering Development Lab Richland, Wash.
R. E. Lerch.
Report HEDL-TME 75-5, May 1975. 90 p, 15 fi 29 tab, 27 ref.

Descriptors: *Nuclear wastes, *Waste treatme Engineering feasibility, Chemical reaction *Degradation(Decomposition)
Identifiers: *Acid digestion.

Tests using a 200 liter Acid Digestion Test Unit i dicated the engineering feasibility of the proce and showed acid digestion to be a potentially a tractive method for treating combustible nucle wastes. Hot concentrated sulfuric acid deco posed all common combustible waste materi when nitric acid was added as an oxidant. Deco position produced an inorganic residue of sulfat and oxides having a volume of about 2-4% of t initial waste. Plutonium was largely converted t nonrefractory form which is readily leached fr the residue with nitric acid. Sulfuric acid is reu ble. Nitrogen and sulfur oxides can be oxidized provide a recyclable acid. (Chilton-ORNL)

FUNDAMENTAL STUDY ON THE POST TREATMENT OF RO PERMEATES FROM ARMY WASTEWATERS,
Illinois Univ. at Urbana-Champaign. Dept. of Environmental Engineering.
E. S. K. Chian, and P. P. K. Kuo.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-021 476, $6.00 in paper copy, $3.00 in microfiche. Technical Report UILU-ENG-75-2026, October, 1975. 131 p, 44 fig, 19 tab, 74 ref, 2 append.

Descriptors: *Waste water treatment, *Pollutant identification, *Biological treatment, *Analytical techniques, *Tertiary treatment, Organic matter, Waste water(Pollution), Ozone, *Reverse osmosis.

The removal of organic matter in MUST hospital waste water after the reverse osmosis (RO) process by treating with ozone, activated carbon, and ion-exchange resins was studied. Biological pretreatment of MUST waste water followed by ultrafiltration (UF), RO and ozone processes were also studied for the removal of gross organic matter. Pretreatment of RO permeates by activated carbon enhanced organic removal by ozonation while ion-exchange pre-treatment hindered its removal. Organic removal by both activated carbon and ion-exchange pre-treatment was enhanced when the RO permeates were pretreated with ozone. The advantage of biological pre-treatment for reducing the power requirement for the later ozonation step was not obvious. The mechanism of organic removal by ozonation followed pseudo first order reaction kinetics during the early stage. Pseudo first order kinetics were also found in the second stage of ozonation, but at a greatly reduced rate. Stripping and distillation techniques and direct GC analysis were developed to analyze volatile organic compounds present in RO permeates. Solvent extraction coupled with high pressure liquid chromatography (HPLC) technique was developed to analyze nonvolatiles. Methanol and acetone were present in most of the RO permeates of MUST hospital wastes and o-toluidine and NN-diethyl-m-toluamide were present in the RO permeate of composite waste. (Snyder-FIRL)

AMMONIA REMOVAL FROM WASTEWATERS: A REVIEW OF THE STATE OF THE ART,
Army Dugway Proving Ground, Utah.
J. H. Whiting, and A. P. Adams.
Available from the National Technical Information Service, Springfield, VA 22161, as AD-A020 698, $4.00 in paper copy, $3.00 in microfiche. Technical Report 4904, Picatinny Arsenal, Dover, N. J., January, 1976. 57 p, 9 fig, 2 tab, 15 ref, 2 append.

Descriptors: *Waste water treatment, *Ion exchange, *Reverse osmosis, *Ammonia, *Nitrification, *Denitrification, Waste water(Pollution), Industrial wastes, Evaluation, Nitrates.
Identifiers: *Ammonia removal, Nitrification-denitrification, *Air stripping, Breakpoint chlorination.

Processes to remove ammonia from munitions plant waste streams were reviewed and evaluated. Various explosive wastes and high levels of ammonia and nitrates are present in these waste waters. Abatement regulations require removal of both the ammonia and nitrates. Several processes, such as air stripping, ion exchange, and breakpoint chlorination, are effective in the removal of ammonia from waste waters, but they do not reduce the nitrate concentration. Other processes must be used to remove the nitrates, imposing additional costs. Biological nitrification-denitrification effectively reduces both ammonia and nitrate concentrations in the waste water. Ammonia is biologically oxidized to nitrite, then to nitrate which, in turn, is reduced to nitrogen gas by the biological denitrification process. It is clean, efficient, and cost-effective. Reverse osmosis was also studied. (Snyder-FIRL)

A TECHNICAL, ENVIRONMENTAL AND ECONOMIC EVALUATION OF THE 'WET PROCESSING SYSTEM FOR THE RECOVERY AND DISPOSAL OF MUNICIPAL SOLID WASTE'.
Systems Technology Corp., Dayton, Ohio.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 674, $7.75 in paper copy, $3.00 in microfiche. Report EPA-530-SW-109c, 1975. 217 p, 34 fig, 20 tab, 9 append.

Descriptors: *Waste water treatment, *Biochemical oxygen demand, *Treatment facilities, *Recycling, *Solid wastes, Municipal wastes, Economics, Grants, Waste disposal, Evaluation.
Identifiers: Municipal solid waste, Demonstration grants, *Wet processing system.

Results are presented of a technical, economic, and environmental evaluation of the wet processing concept for the disposal of solid waste. The facility studied was the Franklin Solid Waste and Fiber Recovery Plant, in Franklin, Ohio. The facility consists of three major systems; Hydrasposal (containing the pulping, separation, dewatering and incineration subsystems); fiber recovery; and glass recovery. When fiber recovery is not used, the facility requires additional water for pulping, but does not discharge water that would require treatment by a waste water treatment plant. With fiber recovery operational, the plant sends 2500 gallons of whitewater/ton of input refuse for treatment to the adjacent waste water treatment plant. Of the 3060 gallons of water/ton of input refuse required, 2300 gallons/ton comes from the final clarified water of the waste water treatment plant. Pulping and separation (P&S) involves dividing the solid waste into light and heavy streams. Waste water treatment sludge is introduced into the stream prior to the cone press dewatering step, the second of two steps in the dewatering process. The fiber recovery system receives the light fraction from the P&S subsystem and recovers a portion of the usable fiber contained in it. The impact on water quality as assessed by evaluating the influent and effluent flows. The output from the venturi scrubber does not require biological treatment, only solids removal. Eighty-one percent of the suspended solids loading and 73% of the biochemical oxygen demand (BOD) loading of the effluents leaving the plant are contributed by the effluent from fiber recovery. Economic data were developed for all major subsystems within the plant. (Snyder-FIRL)

REST AREA WASTEWATER TREATMENT AND DISPOSAL,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
J. T. Pfeffer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 061, $4.50 in paper copy, $3.00 in microfiche. Report UILU-74-2030, November, 1974. 48 p, 4 fig, 12 tab, 15 ref. IHR-701.

Descriptors: *Waste water treatment, *Treatment facilities, *Water reuse, *Waste water disposal, *Aerated lagoons, Physical control, Highways, Water quality, Flow.
Identifiers: Highway rest areas, Series lagoons, Physical-chemical treatment.

Waste water treatment and disposal practices at interstate highway rest areas were studied. Rest area usage was analyzed to provide information regarding th quantity and quality of waste water as well as the variation in waste water flow. The in-

formation obtained has been used to evaluate potential waste water treatment systems for rest areas. The major criteria used to evaluate the systems were process stability under widely fluctuating loadings, simplicity of operation, and aesthetic qualities. A series lagoon system most nearly satisfies these criteria. An aerated lagoon can be used as the first cell of the lagoon system when land or excavation costs are high, greatly reducing land area requirements. For rest areas having inadequate water supplies, the waste water can be reused for nonpotable uses. A physical-chemical system will produce effluent that will satisfy the quality requirements for nonpotable reuse. This type of system was analyzed for this putpose. Previous phases of the project are summarized. They include an analysis of existing data on the quality and quantity of waste water from interstate highway rest areas and an analysis of potential treatment systems for these waste streams. Laboratory data were obtained for the chemical treatment of the waste water from a rest area and are presented. (Snyder-FIRL)

RAW SEWAGE COAGULATION AND AEROBIC SLUDGE DIGESTION,
Environmental Science and Engineering, Inc., Gainesville, Fla.
R. H. Jones, T. A. Burnszytnsky, and J. D. Crane.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 107, $6.00 in paper copy, $3.00 in microfiche. Report EPA-600/2-75-049, November, 1975. 126 p, 31 fig, 16 tab, 20 ref, 4 append.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Biochemical oxygen demand, *Chemical oxygen demand, Treatment facilities, *Sludge digestion, Waste treatment, Waste water(Pollution), Sludge disposal, *Aerobic treatment.
Identifiers: Sludge drying.

Chemical coagulation of raw sewage was studied with laboratory tests and at a sewage treatment plant. A clarifier was converted to a chemical coagulation reactor and clarifier, and polyelectrolyte addition evaluated at various dosages and mixing speeds. Although various polyelectrolytes were efficient in the laboratory, they were less so in full-scale tests due to inadequate mixing. Significant biochemical oxygen demand (BOD) and suspended solids reductions occurred over a range of electrophoretic mobiligy values. Aerobic digestion of primary sewage sludge was also studied at varying detention times, loading rates, temperature, sludge qualities, seasonal flow, evaporation, and precipitation. Aerobic digester waste sludge may contain 40% less chemical oxygen demand (COD), 80% less BOD, 11% less total solids, and 26% less volatile solids than undigested primary sludge. Operating conditions were optimized based on behavior of digested sludge on sand beds. Properly digested sludge dries in 4 weeks with no objectionable odor. Phosphorus was under 0.4% by dry weight, Kjeldahl nitrogen under 3.7%, and nitrate plus nitrite nitrogen under 0.8 mg/gm of dry sludge. COD, BOD, total and volatile solids were reduced 30 to 50% during 70 days lagooning. Aerobically digested sludge seem amenable to mechanical dewatering. Further gravity thickening was unsuccessful for digested primary sludge. Aerobic digestion stabilizes primary sewage sludge very well. Oxygen uptake rates up to 1.8 mg oxygen/(gm TS)(hr) occurred for digestion tests with sludge ages over 20 days. (Snyder-FIRL)

STATE OF THE TECHNOLOGY SEMI-AUTOMATIC CONTROL OF ACTIVATED SLUDGE TREATEMENT PLANTS.
Los Angeles County Sanitation Districts, Whittier, Calif.
C. A. Nagel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 067, $7.75 in paper copy, $3.00 in microfiche. Report EPA-600/2-75-058, December, 1975. 212 p, 59 fig, 14 tab, append.

Descriptors: *Waste water treatment, Analytical techniques, *Treatment facilities, *Automatic control, *Data processing, Waste treatment, Waste water(Pollution), Data storage and retrieval.

Devices that allow waste water treatment plant operators to monitor variable constitutents, calculate important operating parameters, set and maintain proper process controls, and activate alarms are desirable, but present certain problems. The theory, design and operation of continuous on-line instrumentation currently in use by the County Sanitation Districts of Los Angeles County, California are documented, and computer applications which provide daily operational calculations are described. Aspects of instrumentation discussed include water level control of influent pumping, density control of primary sludge pumping, and process air, return sludge and waste sludge control in activated sludge plants. Theory, design, operation characteristics, and maintenance requirements are presented for each system. A computer application system provides daily operational parameters to the operators and prepares a monthly summary of operations reports. Other computer applications are reviewed, and a subroutine to compare effluent characteristics with discharge limits is included. These systems have proven to be reliable and practical. (Snyder-FIRL)
W76-12860

ECONOMICAL RESIDENTIAL PRESSURE SEWER SYSTEM WITH NO EFFLUENT,
SIECO, Inc., Columbus, Ind.
G. F. Hendricks, and S. M. Rees.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 195, $5.00 in paper copy, $3.00 in microfiche. Report EPA-600/2-75-072, December, 1975. 73 p, 18 fig, 10 tab, 4 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Sewers, Sewage, Sewage disposal, Lagoons, *Indiana.
Identifiers: Pressure sewers, Effluent irrigation, Grandview Lake(Ind).

As the water level in Grandview Lake, Indiana, rose, it became polluted with effluent from septic tanks in the area. A conventional gravity sewer system and treatment plant would have been prohibitively expensive. A pressure sewer system with no polluting effluent was designed, constructed, and monitored for effectiveness. The elimination of groundwater infiltration and restrictive elevation tolerances associated with a conventional gravity sewer system enabled it to be installed and to function economically. Aerobic and anaerobic lagoon storage with subsequent irrigation of the effluent were used for treatment and yielded no more than normal volume of runoff. Inefficient home grinder-pump units resulted in operational problems with the pressure system. Commercially manufactured home units greatly reduced these problems and increases in hor construction resulted, then, the initial irrigati area proved inadequate and additional irrigati areas were made available. Domestic sewa nitrogen and phosphate were largely converted vegetation at a reasonable cost. The treatme method produced no objectionable odors. So additional operation and maintenance proble were caused by ground raw sewage due to the n ture of the solids. Homeowners should be ec cated in the proper operation and maintenance their home units. Any check valves in the ho units should have a gate that, when closed, is at oblique angle from the perpendicular alignment the centerline of the flow in the pipe in order to u the gravitational advantage. Mechanical se should be used when possible in infield fabricati operations to prevent leakage due to high grou water conditions. (Snyder-FIRL)
W76-12861

ULTRAVIOLET DISINFECTION OF A TIVATED SLUDGE EFFLUENT DISCHARGE TO SHELLFISH WATERS,
Clow Corp., Florence, Ky.
J. A. Roeber, and F. M. Hoot.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-249 4 $5.00 in paper copy, $3.00 in microfiche. Rep EPA-600/2-75-060, December, 1975. 93 p, 12 f 13 tab, 7 ref, 6 append.

Descriptors: *Waste water treatment, *Sewa treatment, *Activated sludge, *Sewera *Analytical techniques, Chemical oxygen dema Treatment facilities, *Disinfection, *Ultravio radiation, Shellfish, Turbidity.
Identifiers: Static tests.

A tertiary treatment plant and an ultraviolet di fection chamber were installed following an tivated sludge plant at a municipal sewage tre ment plant. The effluent flows under ultravio lights through troughs. The amount of reaching the bottom of the trough is measured the UV is below a preset point known to g satisfactory disinfection, the effluent is autom cally discharged to a holding lagoon instead of receiving water. After the malfunction is c rected, the lagoon-stored effluent is pumped b through the plant for treatment. The determinat of the coliform most probable number (MPN) the primary evaluation test. MPN was not to more than 70 per 100 ml. In static tests, an aver ultraviolet dose of 25,000 microwatt sec per sq with an exposure time of 120 sec was required produce an effluent with a coliform MPN In less than 70. In flow-through tests, the colif MPN was usually below 70 when the turbidity below 11 JTU. The absorption of ultraviolet ra tion was much more dependent on chemical ygen demand (COD) than on turbidity. Expos of samples to visible light after a sublethal dos ultraviolet exposure favors the continued multi cation of bacteria. Bacteriophage inactivation lowed first order kinetics. Coliform inactivat followed first order kinetics until 99.99% inacti tion; followed by a tailing-off curve. Ultravi disinfection of effluents containing high solids high organics was not possible. design, the construction and the first year's
ation of the 1. 5 mdg tertirary treatment plant
ted in Ely, Minnesota are discussed. The terti-
reatment plant was constructed to reduce the
unt of phosphorus in the effluent from the ex-
g filter plant, a point source that produces 80%
ie phosphorus and about 1% of the surface
entering culturally eutrophic Shagawa Lake.
tertiary plant was designed and constructed to
ce the total phosphorus concentration in the
ing filter plant effluent to 0.05 mg/liter, and
sts of flow equalization, two-stage lime
fication followed by dual-media filtration and
ination. The cost of treatment averaged
/cu m. Effluent total phosphorus concentra-
veraged 0.045 mg/liter. Performance data for
icility are included. The tertiary influent tank
he manually operated pump controller served
mpen hydraulic variations. The first-stage
clarifier removed an average of 93.5% of the
influent phosphorus, while removal from
tage clarification averaged 98%. The removal
luble phosphorus, particulate phosphorus,
otal phosphorus averaged 3%, 84% and 49%,
ctively. Sludge handling problems encoun-
were high solids in the thickener overflow
o poor settling characteristics of the com-
sludges and odors caused by processing un-
ed sludge. Conditioning sludge with lime in-
d the filter yield by 81%. Pertinent informa-
n suspended solids, turbidity, TOC, calcium
on removal is included. Waste water flow,
cal dose, pH, clarifier solids volume and
filter head loss are described. (Snyder-

IMPROVED LIQUID-SOLIDS SEPARATION BY AN ALUMINUM COMPOUND IN ACTIVATED SLUDGE TREATMENT,
Greene County Board of Commissioners, Ohio.
C. F. Lenhart, and J. W. Cagle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 228, $4.50 in paper copy, $3.00 in microfiche. Report EPA-600/2-75-039, September, 1975. 68 p, 34 fig, 3 tab, 9 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Biochemical oxygen demand, *Treatment facilities, *Phosphorus, Sludge digestion, Sewage treatment, Suspended solids, *Separation techniques.
Identifiers: Settling.

The effects of sodium aluminate additions on activated sludge waste treatment were studied. Periods with and without chemical dosing were compared. Feeding sodium aluminate to a small to medium activated sludge waste water treatment plant is practical for gaining several operational benefits, including improved solids handling, easier sludge volume index control, and improved concentration of aerobically digested solids, particularly in cold weather. Sodium aluminate reduced suspended solids carryout of secondary clarifiers, reducing the loading to the microstrainers used for tertiary treatment, and increased sludge density, permitting protection against solids washout during spot flows greater than 164% of designed plant capacity. Phosphorus removal approached 80%; alkaline alumina feed cost $.026 per 1000 gallons of waste water. Flow rates averaging 1.715 to 4.098 million gal per day, from 69 to 164% of design, were treated. Residual benefits accrued for 10 days after aluminate feed stopped; secondary clarifier conditions were not optimum until 3 days to a week after starting the aluminate. Solids settling in aeration basins and secondary clarifiers improved within 24 hr of startup. Thicker return sludge permitted a substantial reduction in waste activated sludge volumes. The secondary clarifier could retain higher MLSS. Return sludge volume rate was lower; less flow volume could deliver the same microorganism quantity. Chlorine demand was reduced; less solids and biochemical oxygen demand (BOD) entered the chlorine tank. BOD and SS loadings to the aeration tanks were reduced and increased concentrations of primary tank solids resulted when alumina was recycled. (Snyder-FIRL)

CURRENT CHLORINATION AND DECHLORINATION PRACTICES IN THE TREATMENT OF POTABLE WATER, WASTEWATER, AND COOLING WATER,
G. C. White.
In: Proceedings of the Conference on the Environmental Impact of Water Chlorination, October 22-24, 1975, Oak Ridge, Tennessee, Oak Ridge National Laboratory, p 7-24. 11 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, *Chlorination, *Water treatment, *Activated sludge, Disinfection, Hydrogen sulfide, Cooling water.
Identifiers: Dechlorination.

In sewage treatment, chlorine is used primarily for disinfection, but it is also effective for the prevention of septicity and the control of hydrogen sulfide generation. It is also used in limited applications such as control of activated sludge, bulking, sludge thickening, the destruction of cyanides, and foul air scrubbing. Chlorine is used in manufacturing ferric chloride, which is an effective coagulant for both potable water and waste water treatment. The amount of chlorine applied varies greatly, 50 to 400 lb per million gallon for waste water as compared to 5 to 100 lb per million gallon for potable water and 20 to 200 lb per million for cooling water. In the final analysis the required use of chlorine in potable water and waste water depends on local and Environmental Protection Agency regulatory requirements. It was stated that there is no alternative to chlorine as a disinfectant and chemical tool in the treatment of potable water, waste water, and cooling water. While there appear to be some disadvantages such as the formation of some undesirable chloro-organics, no other oxidant can combine all chlorine's positive attributes, such as its potency and wide range of effectiveness as a germicide, and its ease of handling, application, measurement, and control. LABORATORY EVALUATION OF POLYMERIC FLOCCULANTS,
McMaster Univ., Hamilton (Ontario). Dept. of Chemical Engineering.
A. Benedek, and J. J. Bancsi.
Journal of the Environmental Engineering Division-ASCE, Vol. 102, No. EE1, p 17-28, February, 1976. 10 fig, 18 ref, 1 append.

Descriptors: *Waste water treatment, *Analytical techniques, *Treatment facilities, *Laboratory tests, *Laboratory equipment, Flocculation, Polymers, Sampling, Settling velocity, *Pollutant identification.

An adaptation of the method of multiple sampling during quiescent settling was used to study flocculation. A 35 cm high batch settling apparatus was used. It included a sampling tube 7.62 cm from the bottom surface and a stirring apparatus. Waste water with coagulant was mixed rapidly for 6 min, then slowly for 14 min. Any polymers used were added at 5 min. After the 20 min of mixing, the mixture was sampled automatically for 40 min as it settled. A Cahn Electro Balance was also used to determine the settling velocity distribution without sampling. An 8 ft high long tube settler was also used to simulate full-scale clarifiers where flocculation can take place during the entire downward passage of a floc. The modified jar test successfully yielded velocity size distributions. Settling in the batch settling apparatus is not affected by sampling errors. Phosphorus precipitate and other suspended solids enmesh in a chemical floc. Phosphorus and suspended solids concentrations are equally effective for monitoring settling. Comparison with results from the long tube settler indicates that the settling rates calculated from the batch settling apparatus test tend to be conservative due to lack of allowance for flocculation during settling. At least 5 min of rapid mix between coagulant and polymer addition, 1 min rapid mix after polymer addition, and 4 min of slow mix for flocculation are recommended for chemical flocculation studies in the batch settling apparatus. HOW TO DESIGN AERATED LAGOON SYSTEMS TO MEET 1977 EFFLUENT STANDARDS - EVALUATION OF KINETIC COEFFICIENTS,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
L. G. Rich, and S. C. White.
Water and Sewage Works, Vol. 123, No. 6, p 90-92, June, 1976. 5 fig.

Descriptors: *Oxidation lagoons, *Aeration, *Waste water treatment, *Kinetics, *Mathematical studies, Dissolved oxygen, Biochemical oxygen demand, Organic compounds, Suspended solids, Biological treatment, Equipment, *Design criteria, *Water quality standards.

Laboratory techniques and mathematical methods for estimating kinetic coefficients associated with the design of aerated lagoon systems are described. Retention time and power input are cited as the two main features of lagoon design. The selection of the former is based on a knowledge of which retention time provides the best solids removal with sedimentation for a particular waste and on the rate of soluble organic removal. The selection of power input is based on the amount of oxygen needed for respiration and biological conversion of the waste water and on the mixing requirements. Laboratory equipment and calculation procedures are illustrated for estimating changes in respiration rates and soluble biochemical oxygen demand, dissolved oxygen depletion rates, substrate removal rates, and respiration coefficients. ESTIMATING THE RELIABILITY OF ADVANCED WASTE TREATMENT,
Environmental Protection Agency, Cincinnati, Ohio.
R. B. Dean, and S. L. Forsythe.
Water and Sewage Works, Vol. 123, No. 6, p 87-89, June, 1976. 4 fig, 2 tab.

Descriptors: *Statistical methods, *Reliability, *Tertiary treatment, *Waste water treatment, *Water quality, Phosphates, Mathematical studies, Evaluation, Performance, Treatment facilities, *Estimating.

Statistical methods for estimating the reliability of advanced waste water treatment plants are discussed. Since the usual measurements of pollutants in waste water are lognormally distributed, plotting the data as a normal distribution is not appropriate and the plotting of cumulative probability distributions on log-probability paper becomes necessary. If a population can be fitted by a log-normal distribution, predictions about future performance can be made with a high degree of co fidence provided that the process is in statisti control (variations appear to result from consist causes). Data on phosphate levels are taken fr an advanced waste water treatment plant and plotted normally and as their logarithms. The la case produces a straight line, with a median va of 0.19 milligrams/liter and a spread factor of The median is a good estimate of the geome mean. (Kreager-FIRL)

COMPUTER HALTS FLOODING CO PLAINTS,
Watermation, Inc., Saint Paul, Minn.
D. J. Anderson, and R. O. Meyers.
Water and Wastes Engineering, Vol. 13, No. 27-28, 30, 32, 62, June, 1976. 4 fig.

Descriptors: *Sewers, *Overflow, *Mathemat models, *Computer programs, *Floo *Combined sewers, Analytical techniques, Co Economics.

The use of a computerized mathematical mode analyze flooding problems and raw sewage o flow has resulted in a cost savings amountin two-thirds that of replacing the sewer system the city of Lakewood, Ohio. The mathema model used to analyze the city's sewer systen volved three routines. One routine calculated amount of rainfall which enters the sewers f the streets, rooftops, and grassed areas; ar second routine determined the amount of flow to the environment at various regulators in system. A third routine computed the travel for a given flow rate to traverse a pipe from the stream to the downstream end. The alterna solution to sewer system replacement selected result of the computerized analysis involved installation of 10 new control regulators to re combined sewer overflow at a cost of about million. ALUATION OF THE REPORT ON INTER-
PTOR SEWERS AND SUBURBAN SPRAWL.
vironmental Protection Agency, Washington,
C. Office of Planning and Evaluation.
ailable from the National Technical Informa-
Service, Springfield, VA 22161 as PB-250 617,
00 in paper copy, $3.00 in microfiche. January,
5. 43 p, 4 tab, 6 append.

criptors: *Waste water treatment, Analytical
niques, *Sewerage, *Flow rates, *Interceptor
ers, Projects, Land use, Land development,
ign, Human population, *Sewers, Evaluation.
ntifiers: Excess capacity.

Environmental Protection Agency (EPA) study
up evaluated the conclusions of the Urban
tems Research and Engineering, Incorporated
R+E) report for the Council on Environmen-
Quality, INTERCEPTOR SEWERS AND
BURBAN SPRAWL. The report, based on an
ysis of 52 interceptor projects and case studies
n the larger sample, concluded that the
ence of Federally financed interceptor sewers
ourages development, and their routing, sizing,
timing influence land use patterns. It also con-
es that current procedures and standards for
gn, review, and financing of projects strongly
ourage unnecessarily large interceptor projects
do not stimulate public participation or ensure
ful assessment of potential adverse secondary
cts and recommends that EPA not provide
eral funds for excess capacity, re-evaluate in-
ptor staging of projects in rapidly growing
s, use realistic standards for estimating per
a flow, improve population forecasting
niques and review procedures, require coor-
ion of environmental effects of interceptor
ced land use, and increase public participation
ublicizing community cost and benefits of in-
ptor induced growth. The EPA group's 74
ct survey agreed that half the land served by
ceptor projects is vacant, but much of this
ring was unavoidable. The EPA disagrees
limiting interceptor design life to 25 yr,
use some projects are likely to be more cost
tive with longer periods. EPA agrees that no
rary gpcd standards should be set; factors like
ined sewers and high infiltration/inflow
ied several seemingly excessive design flows.
EPA group agrees that population forecasting
d be improved but finds the recommendation
nit financial aid to the portion of interceptors
ed for current population inappropriate.

STIMULATION OF DENITRIFICATION IN SOIL COLUMNS BY ADDING ORGANIC CARBON TO WASTEWATER,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
J. C. Lance, and F. D. Whisler.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 346-356, February, 1976. 7 fig, 2 tab, 19 ref.

Descriptors: *Denitrification, *Carbon, *Waste water treatment, *Soil filters, *Recycling, Symbiosis, Nitrification, Nitrogen, Efficiencies, Filtration, Chemical reactions, Organic compounds, Evaluation, Simulation analysis.
Identifiers: Dextrose.

Soil columns were intermittently flooded with waste water adjusted to different soluble carbon concentrations by adding dextrose or methanol to investigate the effect of organic carbon on denitrification. Methanol was not effective in promoting denitrification in soil columns flooded with secondary waste water; however nitrogen removal was increased from 30-90% by increasing the soluble carbon concentration of the waste water to 150 mg/liter via the addition of dextrose. This showed that the organic carbon content of waste water is capable of limiting denitrification in high-rate land filtration systems and that both nitrification and denitrification may be achieved in the same soil profile by alternating flooding and drying periods. Further research is needed to determine if most of the carbon would be removed from primary waste water effluent by high-rate land filtration and to determine if denitrification can be stimulated by adding carbon in a pulse at the beginning of the flooding period. MOGDEN, WHERE SEWAGE WORKS,
C. W. Ireland.
Gas and Oil Power, Vol. 71, No. 787, p 161-162, Winter, 1975. 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Sewage treatment, *Sludge digestion, *Treatment facilities, *Gases, *Fuels, Equipment.
Identifiers: Thames Water Authority, Mogden water works.

Fuel gas for engines is produced from the treatment of sewage at the Thames Water Authority's Mogden works. Heat recovered from the engine cooling systems raises the sludge digestion temperature to about 32C. The engines drive generators for electric pumps and other equipment and air compressors delivering about 4.8 million cu m/day to the activated sludge process. The engine commissioned in 1967 was developed taking into account the difficulties of burning the very heavily contaminated sludge gas, and incorporated numerous special features. The fuel gas carries large quantities of condensate due to the close proximity of the digester to the power house. Operating experience made it possible to develop the most efficient combination of engine components, which included many standard components. This experience allowed the engine installed in 1974 to be designed with components interchangeable with those of the 1967 engine. The 1974 engine also incorporated various improvements. The gas and air are mixed in the combustion chamber to avoid any possibility of an explosive mixture being formed in the manifold. The 1974 engine ran almost continuously for its first 12 months. Both engines are dual fuel engines; a pilot injection of diesel fuel oil promotes ignition of the gas and air. (Snyder-FIRL)

SANITARY LANDFILL LEACHATES AND THEIR TREATMENT,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
E. S. K. Chian, and F. B. DeWalle.
Journal of the Environmental Engineering Division-ASCE, Vol. 102, No. EE2, p 411-431, April, 1976. 5 fig, 6 tab, 52 ref, 1 append.

Descriptors: *Waste water treatment, *Pollutant identification, *Biological treatment, *Analytical techniques, Biochemical oxygen demand, Chemical oxygen demand, *Landfills, *Leachate.
Identifiers: Physico-chemical treatment.

Leachate samples were collected from landfills in different parts of the United States and analyzed for both organics and inorganics. Ratios such as COD/TOC, BOD/COD, VS/FS, and total carbon present in the free volatile fatty acids/TOC were determined for the leachate. These ratios can be used to predict the effectiveness of either biological or physico-chemical treatment methods with a given leachate. Some are also used as an internal check on the reliability of the results of chemical analysis of leachate samples. Leachate from recently leaching landfills is best treated by biological treatment, which is most effective in removing the free volatile fatty acids which are present in large quantities. Physical-chemical treatment is most effective for treating leachate from stabilized landfills or further removing organic matter in the effluent of biological units treating leachate. Activated carbon and reverse osmosis were best among the physico-chemical processes evaluated for removing organic matter. (Snyder-FIRL)

CALCIUM HYDROXIDE (LIME) AND THE ELIMINATION OF HUMAN PATHOGENIC VIRUSES FROM SEWAGE: STUDIES WITH EXPERIMENTALLY CONTAMINATED (POLIOVIRUS TYPE 1, SABIN) AND PILOT PLANT SAMPLES,
Ottawa Univ. (Ontario). Faculty of Medicine.
S. A. Sattar, S. Ramia, and J. C. N. Westwood.
Canadian Journal of Public Health, Vol. 67, No. 3, p 221-226, May-June, 1976. 4 tab, 12 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Pollutant identification, *Lime, *Viruses, Sewage sludge, Waste storage, Temperature, Public health, Pilot plants, *Calcium hydroxide, Chemical precipitation.
Identifiers: Chemical treatment.

Use of lime was studied as a means to eliminate viruses from sewage. Sewage samples were contaminated with poliovirus 1. An aqueous slurry of lime was then added drop by drop until the pH reached 11.5. After 15 more min of stirring, the sample was allowed to stand for one hr. No virus was detected in the resulting supernatant; the virus recovered from the sludge represented only 0.001% of the virus added. This remaining virus was undetectable after storing the sludge for 24 hr at 28C. Lowering the temperature of the samples to 4C did not affect the process efficiency in eliminating viruses. (Snyder-FIRL)

ODOR CONTROL WITH HYDROGEN PEROXIDE,
Pennsylvania State Univ., Middletown. Dept. of Engineering.
C. A. Cole, P. E. Paul, and H. P. Brewer.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 297-306, February, 1976. 5 fig, 3 tab, 5 ref.

Descriptors: *Waste water treatment, Pollutant identification, *Treatment facilities, Odor, Control, Domestic wastes, Industrial wastes, Effluents, Hydrogen sulfide.
Identifiers: *Odor control, *Hydrogen peroxide, Clarifiers.

Hydrogen peroxide treatment was investigated as a method of controlling the odors emanating from the Hershey waste water plant, which treats approximately 2 mgd of domestic and industrial waste. The plant odors came predominantly from the flotator-clarifier effluent that was aerated in the preaeration tank and exposed to air in the plastic media trickling filter and from the intermediate clarifier effluent that was exposed to air in the intermediate rock trickling filter. Hydrogen sulfide produced under anaerobic conditions in the flotator-clarifier and intermediate clarifier apparently produced the odor. Two winter tests followed by continuous use starting in the early summer demonstrated the effectiveness of hydrogen sulfide for controlling the odor. A dose of between 15 and 40 mg/liter hydrogen peroxide divided between the effluent from the plastic media trickling filter and the feed to the flotator-clarifier was effective. On-site observations and off-site tests by an odor panel verified the odor reduction. Adding 10 mg/liter hydrogen peroxide to the feed of the flotator-clarifier and intermediate clarifier during the afternoon high flow time increased the dissolved oxygen (DO) in the effluent of each by one to 2 mg/liter. Adding 10 mg/liter hydrogen peroxide did not improve the early morning low flow DO. (Snyder-FIRL)

THE ECONOMICS OF RECOVERY OF MATERIALS FROM INDUSTRIAL WASTE--A CASE STUDY,
Aston Univ., Birmingham (England). Dept. of Chemical Engineering.
A. V. Bridgwater.
Resource Recovery and Conservation, Vol. 1, No. 2, p. 115-127, 1975.

Descriptors: *Byproducts, *Industrial wastes, *Financial feasibility, *Recycling, *Return(Monetary), Chemical wastes, Europe, Water pollution control, Liquid wastes, Economies of scale, Waste treatment, Organic compounds, Metals.
Identifiers: West Midlands(England).

The viability of recovering materials from liquid and liquid-solid industrial wastes is evaluated. A waste disposal contractor in the West Midland, usually poured acid effluents into old coal mine shafts and phenolic wastes and metal-bearing sludges onto a brickpit surface. Effluents were analyzed for suitability before discharge, except that aqueous cyanide solutions were first oxidized with chlorine. Monitoring of liquids and atmosphere in the mine shaft indicated some acid neutralization and metal adsorption by the rocks occurred. Analyses of effluents and prices of materials contained in or derivable from effluents showed that hydrochloric acid, zinc, and non-ferrous metals were present in relatively large quantities, were the most valuable, and are relatively easy to recover. Preliminary studies for recovery of commercial hydrochloric acid indicated that for acid alone a return of more than 50% might be expected with a payback time of less than two years. For zinc oxide recovery the return was estimated at around 25% with a payback time of about three and a half years. An integrated approach to effluent treatment and material recovery rather than disposal would be more economical, reduce losses of valuable materials, preserve safe disposal sites for intractable wastes, and provide fast, efficient recycling of valuable materials. The attractiveness of recycling nickel and white spirits are illustrated. (Buchanan-Davidson--Wisconsin).

SOLID WASTE: IS THERE A PROFIT POTENTIAL,
Waste Management, Inc., Oak Brook, Ill.
T. Bakkom.
Pollution Engineering, Vol. 7, No. 11, p. 38-39, 1975.

Descriptors: *Recycling, *Industrial wastes, *Waste disposal, *By products, Methodology, Performance, Economic efficiency, Marketing.

The recovery of marketable materials from industrial wastes is contingent on efficient collection, storage, and transportation systems designed for the special production needs, volumes, and hazards of the wastes. Plant production should be studied to identify recoverable materials and determine feasibility of recovering waste fractions for recycling or sale. Recoverable material must be maintained at its maximum value. Containerization, storage, handling, and transportation systems for recoverable and unrecoverable materials from the point of waste generation to their final disposition must be planned. A case study of an international manufacturer and marketer of heavy equipment is presented. Because of environmental problems caused by incineration, alternative methods of waste handling and disposal were chosen. The improved system solved the environmental problem, used less manpower, reduced costs, used a private contractor's ability to recover secondary fibers for resale, handled waste without changing operating procedures or interrupting production, and met all solid waste demands with permitted disposal sites. The system is not currently considered as a 'profit center' but it does reduce the cost of waste handling and disposal--subject to the marketability of the recovered materials--and meets the primary criteria of efficiently removing wastes from production areas. (Buchanan-Davidson--Wisconsin)

PRELIMINARY ASSESSMENT OF SYSTEMS FOR DERIVING LIQUID AND GASEOUS FUELS FROM WASTE OR GROWN ORGANICS,
National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.
R. W. Graham, T. W. Reynolds, and Y. Y. Hsu.
Report No. NASA TN D-8165, February 1976. 41 p. 10 fig., 6 tab., 33 ref.

Descriptors: *Fuels, *Recycling, *Feasibility studies, *Energy conversion, Organic wastes, *Anaerobic digestion, Environmental effects, Pilot plants, Vegetation, Farm wastes, Agriculture, Forests, Economic feasibility, Methane, Technology, Costs, Waste treatment
Identifiers: *Pyrolysis system

The overall feasibility of anaerobic digestion an pyrolysis systems to convert fuels from waste o grown organics is considered as related to th technical, economic and environmental aspect Converting collectable organic waste into fuels ap pears attractive with the added advantage of was disposal. The most conservative estimates indica that 136 million tons/yr is 'readily collectable representing 1.4 in the 15th power Btu/yr; tot U.S. energy consumption in 1971 was 72 in th 15th power Btu/yr. However conversion to liqu or gaseous fuels would reduce the energy conte by the conversion efficiency. In the grown organ option, silviculture as a source of biomass for fu conversion is evaluated and found that at a 50 conversion efficiency the costs of fuel would e ceed the current cost of petroleum. Fuel cr production is not a viable alternative but bioma waste from food crops can be considered as realistic fuel resource. The two conversio processes-fermentation and pyrolosis--are co pared with regard to capital investment, enviro mental impacts, and their versatility. The ener from a system that uses waste and grown organ feedstocks is estimated at 4% to 12% of the 19 U.S. energy consumption. Estimates of mark prices for these fuels are included. (Auen-Wisco sin).

SOLAR ENERGY FIXATION AND CONVE SION WITH ALGAL BACTERIAL SYSTEMS,
California Univ., Berkeley. Sanitary Engineeri Research Lab.
M. Uziel, W. J. Oswald, and C. G. Golueke.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-242 36 $3.50 in paper copy, $3.00 in microfiche. Progre Report No. NSF-RA-N 74-195, December 1974. p. 1 fig., 4 tab. NSF-RANN-SE GI-39216.

Descriptors: *Electric power productio *Methane, *Energy conversion, *Solar radiatio Anaerobic digestion, Waste treatment, Recyclin Scenedesmus, Euglena, Laboratory tes Nitrogen, Harvesting of algae, Fermentatio Cyanophyta, Chlorophyta, *Economic feasibilit Identifiers: Spirulina, Melosira, Oscillator Micractinium, *Solar energy fixation, *Solar en gy conversion.

The results of continuing laboratory tests co ducted to determine the economic feasibility o process based on the utilization of algal-bacter cultures in sewage to fix solar energy into algal c lular material, which in turn is converted methane by anaerobic digestion; the methane to used through combustion for the generation electricity. Implicit in the recycling aspects are t utilization of wastes and a source of nitrogeno fertilizer. This phase of the investigation produc data for the kinetic modeling of algae and metha production (anaerobic digestion) processes, a energy transformations; and the assessment of t comparative fermentability of Melosi Scenedesmus, Euglena, Micractinium, Spirul and Oscillatoria. The overall results indicate th with the exception of Melosira, all the spec tested could serve equally well as a fermentati substrate for gas production. The methane conc tration of the gas produced ranged from 69% 71% of the total gas. The stability and reliability the system was well demonstrated. Gas compo tion is not affected by type of algae ferment Nitrogen is supplied by the sewage and/or mospheric fixation by the blue-green algae. A nitrogen introduced into the system can be ke within the system by recycling digester effluent the algae ponds. (Auen-Wisconsin).

Identifiers: *Romania.

Traditionally, in raising farm animals, the problem of waste disposal has been solved by utilizing the waste in liquid or solid form as agricultural fertilizer. The quantity of waste material that can be so used is limited since the overmanuring of land is unfavorable for crops. There is also the danger that large quantities of pollutants may enter natural waters. In modern pig raising centers comprising herds of 100,000 animals, the litter is evacuated hydraulically, a process that uses 3000-4000 m3 of water/day. The resulting pollution is equivalent to a town of 200,000-300,000 inhabitants. Such large units usually do not have access to fields large enough (3000-4000 ha) to dump their litter. Dumping the waste water into a river is usually not possible, except after mechanical and biological purification to avoid serious pollution. Technological processes to solve such problems follow in general those of urban water purification plants; these involve separation of solids, settling ponds, chlorination, incineration, dehydrating muds, agricultural uses and composting. The operation of several stations in Rumania is described.–Copyright 1975, Biological Abstracts, Inc.

ENVIRONMENTAL CONTROL IN PLANTS AT MINIMUM COST,
C. D. Burnham.
Water and Pollution Control, Vol. 114, No. 6, p 6-8, 9, June, 1976. 4 fig.

Descriptors: *Water pollution control, *Industrial wastes, *Water reuse, *Design criteria, *Byproducts, Operations, Economics, Toxicity, Drainage systems, Equipment, Materials, *Waste water treatment.

Design and operating practices for controlling water pollution from waste treatment operations at a minimum cost are reviewed. The most effective way to eliminate pollution is at the source by means of raw material, process, and/or equipment changes. For example, the use of countercurrent double rinse tanks that require water addition only when the rinse water is too dirty can reduce drainage system requirements in the metal finishing industry. Segregation of drainage systems can be used to avoid the discharge of possible toxic combinations. Site selection is another factor in achieving environmental control at minimum cost; care should be exercised to avoid building a facility on a flood plain. Water reuse is a pollution control technique which also can provide valuable byproducts and an inexpensive source of process water. An example of water reuse in a cresylic acid plant is presented. (Kreager-FIRL)

LATEST U. S. SEWAGE REGULATIONS,
W. F. Roberts.
Marine Engineering/Log, Vol. 81, No. 6, p 34-37, June, 1976. 2 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Biological treatment, *Sewerage, *Treatment facilities, *Regulation, Ships, *Water quality standards.

Legal terms relating to shipboard sewage treatment are defined. Only sewage and other waste water coming into contact with it are required to be treated. The three basic negative effects of dumping raw sewage from vessels are the visual insult of raw sewage, the health hazard from pathogenic organisms and the pollution problems, such as oxygen depletion of the water. The harmful effects of vessels on the open seas are marginal, but serious problems can be caused in estuaries, bays, rivers, and lakes. Flow-through sewage treatment is now allowed for all oceangoing vessels. Tests and certification are required for these systems. Possible marine sanitation devices (MSD's) to meet the regulations include a holding tank, vacuum or pressure flushing, total incineration, maceration/chlorination, biological flow-through treatment, physical-chemical flow-through treatment, recycling, and individual unitized toilets. Operational considerations include as much automatic operation as possible, a minimum of sewage treatment skills required, minimum use of expendables, reliability, ease of maintenance, minimizing personnel objections, and elimination of need for shore accomodations. Different systems are more appropriate in different situations. A compilation of manufacturer's information on MSD's is included. (Snyder-FIRL)

WASTE DISPOSAL IN SEAFOOD PROCESSING: PUBLIC OR PRIVATE,
Georgia Univ., Athens. Inst. of Natural Resources.
R. M. North.
In: Coastal Plains Center for Marine Development Services 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 29-36. 7 ref.

Descriptors: *Fish handling facilities, *Waste treatment, *Economic efficiency, Economic impact, Third party effects, Equity, Water quality, Cost sharing, Coastal plains, Water pollution control, Treatment facilities, Effluents, Standards, Legislation.
Identifiers: *Seafood processing wastes.

The variables involved in decision making by the coastal seafood processing industry with regard to waste disposal and effluent treatment are discussed in relation to the general aspects of benefit and cost distribution between externalities and economic impact, i.e., attaining efficiency in

waste management. Decisions must also be based on the extent of water quality desired, what institutional arrangements are required, and how should the water quality levels adopted be paid for. The stricter federal and state regulations for effluent discharges influence the decision whether to install private treatment facilities or enter into contracts with municipalities; the latter would involve considerations of contractual constraints and the risks of escalating municipal charges; the former would involve escalating construction and operating and maintenance costs and firm's ability to effectively manage the treatment system to avoid penalties or litigation. The dilemma in coastal areas is the question of determining the economically efficient levels of waste treatment to comply with the latest federal water pollution control legislation. The solution lies by the industry and public offices to work out an economically efficient system of seafood waste treatment which fully considers the real demands for water quality, the best institutional arrangements to meet such demands, and the equitable apportionment of costs among the consumers of water quality. SEASONAL VARIATIONS IN THE PURIFICATION OF TREATMENT PLANT EFFLUENT IN NATURAL SAND DEPOSITS,
Rensselaer Polytechnic Inst., Troy, N. Y. Fresh Water Inst.
D. B. Aulenbach, N. L. Clesceri, L. Hajas, and S. Beyer.
Report FWI 76-1, January 1976. 41 p. 24 fig., 2 tab., 13 ref. EPA R803452-01, DACA 89-74-1637.

Descriptors: *Seasonal, *Waste Water treatment, *Efficiencies, *Sands, *Tertiary treatment, *New York, Groundwater, Seepage, Infiltration, Hydrogen ion concentration, Chlorides, Dissolved solids, Dissolved oxygen, Nitrogen, Phosphorus, Alkalinity, Coliforms, Biochemical oxygen demand.
Identifiers: *Lake George Village(NY), West Brook(NY), Lake George(NY).

Effluents from the Lake George Village Sewage Treatment Plant, New York, were studied to determine if the final treated effluent quality varied seasonally. A deep natural sand deposit near the lake is used for tertiary treatment. Most of the effluent re-emerged from the ground along with additional groundwater. Flow did not vary during fall and winter, but increased in spring due to increased runoff and infiltration; high summer flows occurred during the tourist season. Flows have increased since 1968 when the sewer district was enlarged. Temperature, alkalinity, pH, chlorides, dissolved solids, dissolved oxygen, nitrogen, nitrates, ammonia, and phosphorus were studied seasonally at the various seepage areas and in West Brook which carries the seepage to Lake George. In West Brook, dissolved oxygen, alkalinity, dissolved solids, and chloride levels were high; nitrogen oxidized to nitrate, and phosphorus was reduced to below natural groundwater levels; and coliforms and biochemical oxygen demand levels were extremely low, so that the water is suitable for drinking. The present system provides adequate treatment, even during seasonal stress. Water quality in Lake George is not being strained. Disposal of sewage effluents onto soil provides the equivalent of tertiary treatment, especially for phosphorus removal, at minimum cost. (Buchanan-Davidson--Wisconsin).

METHOD AND APPARATUS FOR TREATING LIQUID CONTAMINATED WITH RADIOACTIVE PARTICULATE SOLIDS,
Hydromation Filter Co., Livonia, Mich. (Assignee).
G. Hirs.
U. S. Patent No. 3,962,078, 8 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 753-754, June 8, 1976.

Descriptors: *Patents, *Waste water treatment, *Radioactive wastes, Water pollution sources, Nuclear wastes, *Radioactive waste disposal, Water pollution treatment, Water pollution control, Filtration, Water reuse, Filters, Screens.
Identifiers: Granular filter bed.

A method and apparatus reduces the amount of radioactive solids resulting from the filtration of particulate contaminants from liquid in a nuclear reactor plant. A filtration system includes a prefilter comprising a sheet filter medium through which the reactor liquid passes to remove relatively large particulate contaminants for storage or disposal. The reactor liquid is then passed through a bed of granular filter medium to accumulate substantially all previously non-filtered contaminants and thereby provide a clarified liquid suitable for reuse in the reactor. Backwash liquid is flowed through the granular filter bed to remove and entrain the accumulated contaminants into a slurry which is received by a reservoir where the slurry is maintained quiescently to settle the contaminants. Removal of liquid from the reservoir concentrates the contaminants for storage or further processing, without the necessity of large quantities of filter aids that would increase the quantity of storage-requiring contaminated solids. SODIUM SULFUR OXIDES WASTES DISPOSAL PROCESS,
Industrial Resources, Inc., Chicago, Ill. (Assignee).
J. M. Dulin, E. C. Rosar, R. B. Bennett, H. S. Rosenberg, and J. M. Genco.
U. S. Patent No. 3,962,080, 13 p, 12 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 754, June 8, 1976.

Descriptors: *Patents, *Industrial wastes, *Waste water treatment, *Water pollution treatment, Water pollution control, Water softening, Demineralization, Sludge treatment, Sodium compounds, Electric powerplants, Heat treatment, *Waste disposal.
Identifiers: Sintering, Blow-down sludges.

In preparing water for use as boiler feedwater, makeup water, or in cleaning up condenser water, nuclear reactor coolant water, spent fuel storage water, sump waste water, rad wastes, deborating units, and decontamination units, ambient or recirculating water supplies are decontaminated or demineralized to remove various components. Sodium sulfur oxide compounds are produced as by-products from such industrial processes. Still another source of sodium sulfate is that contained in the blowdown from nuclear or fossil fuel fired power plant cooling towers. This patent describes a process which results in reducing the solubility of waste sodium sulfite and sulfate. Alkali metal sulfur oxide compounds are mixed with fly ash, formed into an agglomerate particle, and sintered at temperatures ranging from 1000 -2300F for a period of time, dependent principally on the specific heat of the mixture. The sintering may take place under oxidizing or slightly reducin conditions, at sub- or super-atmospheric pressure although ambient oxidizing and atmospheric pre sure conditions are preferred. The agglomerat may be a pellet containing a binder, may be sel bound as with water, or may be briquetted unde pressure. The end-product shows reduced solubil ty of the sodium sulfur oxide compounds fixing heavy metal or radioactive components in the as reduced volume and increased density. The part cle is suitable for use as such as an aggregate, e g as mulch or road bed fill, or used as an aggregate a composition such as in concrete, a pozzola asphalt, ceramics (bricks). (Sinha-OEIS)
W76-13143

RAIN STORING TANK,
G. Nussbaum.
U.S. Patent No. 3,962,084, 4 p, 18 fig, 13 ref; Official Gazette of the United States Patent Offic Vol 947, No 2, p 755, June 8, 1976.

Descriptors: *Patents, *Waste water treatmen *Water storage, Water pollution treatmen *Water pollution control, Water quality contro *Storage tanks, *Rainwater, Surface runoff, E cess water, Storm drains, Combined sewer Storm water.

A rainstoring tank of substantially circular desig is inserted in a main sewer which leads to the p rification plant of a combined-water sewer syste The tank is provided with tangentially enterin combined-water channel and a sanitary sewag drain leading from the center of the tank bottom the purification plant. In dry weather the sanita sewage flows from the periphery directly to th central drain. However when it starts raining, th combined water shoots, because of its kinet energy, tangentially into the tank and removes, b rinsing, the polluted sediments from the tank bo tom. The tank capacity stores the first, strong polluted rain water surge and prevents th discharge. Heavier sanitary sewage materials a conveyed, by cyclonic effect, first outward an then, by the superposed toroidal flow, via the tan bottom to the sanitary sewage outlet. While th tank is being increasingly filled up to the relie gate, the flow quiets down and a mechanical p rification takes place, so that during persistin rainfall mechanically purified combined water ca drain. While the tank is being emptied the flo continues to feed the purification plant uniformly and the originating eddy or spiral flow assures sweeping water force sufficient for a thorough cleansing of the tank bottom. DYNAMIC PROGRAMMING MODEL FOR WASTEWATER PLANT INVESTMENT,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
J. M. Armstrong.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 102, No EE5, p 985-1003, October 1976. 14 fig, 2 tab, 12 ref.

Descriptors: *Sewage treatment, *Treatment facilities, *Waste water(Pollution), *Dynamic programming, *Decision making, *Investment, Planning, Engineering, Water quality, Methodology, Equations, Capital costs, Operating costs, Technology, Systems analysis, Mathematical models.
Identifiers: *Capacity expansion, Cost minimization.

The problem of wastewater treatment plant capacity is examined. A decision model, which utilizes a dynamic programming formulation, is developed which generates optimum plant capacity expansion strategies. The model allows for variation in available treatment technology, capital and operating costs, demand based on different population projections, and changes in construction and labor cost indices. The methodology of the model is readily usable by managers and decision makers interested in exploring short-term or long-term plant expansion programs. Comparison with other research on capacity expansion is made and the model is found consistent with previous theoretical results. (Bell-Cornell)

OPTIMAL DESIGN OF WASTEWATER COLLECTION SYSTEMS,
Roorkee Univ. (India).
J. M. Gupta, S. K. Agarwal, and P. Khanna.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, p 1029-1041, Vol 102, No EE5, October 1976. 7 fig, 3 tab, 13 ref.

Descriptors: *Sewage treatment, *Waste water(Pollution), *Optimization, *Design, Computers, Hydraulic models, Economics, Constraints, Equations, Algorithms, Systems analysis.
Identifiers: *Cost minimization, *Waste water collection, Nonlinear programming, Global optimum.

The most sought-after requirements of an optimization algorithm are with respect to computer time and memory. For the six-link system, the time required for execution of a program is 70 seconds on an IBM-360 (Model No. 44) computer, indicating that the algorithms are fast converging. Further, it takes only 75 seconds to compile and load the program on a disk. The requirement of storage space is also very small. The total memory requirement on this computer is 9E8 bytes. A nonlinear algorithm based on Powell's method of conjugate directions is developed to optimize the design of wastewater collection systems. The algorithm is fast converging, requires small computer memory, employs the discrete set of commercially available diameters, and leads to a global optimum. The economics of optimal and conventional designs is compared for a six-link wastewater collection system at Roorkee, India. Also, a parametric study is presented. (Bell-Cornell)

Water Resources Research, Vol. 12, No. 4, p 581-591, August 1976. 13 fig, 1 tab, 22 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Estuaries, *Optimization, *Economics, *Design, *Water quality control, Regions, Sewage treatment, Rivers, Costs, Piping, Pumping, Dissolved oxygen, Dynamic programming, Linear programming, Equations, Algorithms, Alternative planning, Management, Mathematical models, Systems analysis.
Identifiers: Cost minimization, Heuristic location techniques, *Delaware Estuary.

The problem of determining the optimal number, location, and level of treatment for regional domestic sewage treatment plants along an estuary or river is considered. The formulation is one of minimizing the sum of treatment and transport (piping and pumping) costs such that water quality improvement goals for dissolved oxygen are met. Restrictions may also be placed upon the overall level of treatment (required secondary, required uniform, or least cost) if desired. An optimization procedure is developed which utilizes dynamic programing, linear programing, and heuristic location techniques in a series of steps which lead to progressively improved (lower total cost) solutions. The location procedure is intended for use by an engineer-planner during the design stage and requires his participation and skilled judgment during the course of the algorithm. The technique is illustrated for the Delaware estuary for 22 domestic waste sources, nine potential regional sewage treatment plant sites, and 22 industrial waste sources. Results of the case study show considerable savings over previous nonregional treatment schemes. (Bell-Cornell)

Identifiers: *Alum sludge, Natural freezing, *Freeze treatment.

Improving sludge characteristics by freeze treatment and application of the method to difficult sludge situations were studied. The sludge particles are dehydrated when the water closely associated with them freezes. After thawing, the particles retain the new sizes and shapes produced by dehydration, and the consequent rapid dewatering properties. The sludge must be frozen completely for a sufficient length of time to dehydrate the particles. Freeze treatment is sometimes followed by thickening and drying steps, but the drainage properties of the treated solids are so good that the treated slurry could be sent directly to a lagoon or drying bed. Natural freezing could be used in cold climates in winter if the sludge is completely frozen and the treated solids can be conveniently harvested after thawing. The refrigeration equipment for freeze treatment is relatively maintenance-free and operates continuously without operator attention. The electric power to operate such a unit often costs the same or less than the pre-treatment chemicals that would be required for other treatment methods. Freeze treatment is effective for any sludge quality. Because no chemical conditioners or additives are used, they cannot leach into ground water when the sludge is used as land fill. The freeze-treated sludge alone can support vegetation. Because this sludge retains its good dewatering and drainage properties indefinitely, it will not become gelatinous and cause drainage problems in a land-fill operation. (Snyder-FIRL)

ilable from the National Technical Informa- Service, Springfield, VA 22161 as PB-248 524, 0 in paper copy, $3.00 in microfiche. Report EPA-600/2-75-043, October 1975. 105 p, 31 fig, ab, 46 ref. EPA R-801397.

criptors: *Waste disposal, *Landfills, *Sludge osal, Waste treatment, Aerobic treatment, erobic digestion, Leachate, Leaching, Wastes, d wastes, Activated carbon, Hydrogen ion centration, Organic wastes.
tifiers: *Leachate recirculation, Leachate ment, Landfill stabilization.

lts of an experimental system for study of fill disposal of approximately 0.3 cu m (10 cu f domestic refuse were provided. The study uated not only traditional landfill decomposi- as represented by single pass of water nating from rainfall but also recirculation of collected leachate. Sewage sludge addition to olid waste and pH control of the recirculated ate were also evaluated. Biological and physi- hemical methods for treatment of leachates, cially those derived from the stabilized solid e undergoing leachate recirculation, were also uated. Analysis of about 3 years of data in- ed that leachate recirculation was very ficial in accelerating the removal of at least eadily available organics from the refuse and ate. This rate of removal, accomplished over iod of months for the recirculated units as pared to the traditional, single pass unit, was er enhanced by the initial addition of sewage e and by pH control. The leachate treatment es indicated that either aerobic or anaerobic gical processes successfully remove leachate ics and that the effluent residuals could be ed by activated carbon adsorption and/or ion nge either separately or in combination. -ISWS)

APPARATUS FOR SOFTENING HARD WATER,
Maruyama Mfg. Co. Ltd., Tokyo (Japan). (Assignee).
Y. Fulukawa.
U.S. Patent No. 3,962,089, 7 p, 22 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 757-758, June 8, 1976.

Descriptors: *Patents, *Water treatment, *Water purification, *Water softening, Water quality, Demineralization, Hardness(Water), Ion exchange, Resins, Equipment, Valves.

An apparatus for softening hard water is described. A raw water pipe, a soft water pipe, a discharge pipe and a salt water pipe are connected with a cylindrical valve seat equipped on a softening tank accommodating a layer of ion-exchange resin. A rotary valve is installed in the cylindrical valve seat and is provided with a passage through which the raw water pipe, soft water pipe and discharge pipe can be separately connected with a water pipe erected through the ion-exchange resin layer. Through rotation of the rotary valve, the combinations of (1) a raw water pipe and soft water pipe, (2) raw water pipe and discharge pipe and (3) walt water pipe and discharge pipe can be alternately connected with the softening tank. A controlling circuit is provided with a floating switch installed in the softening tank, so that when the water level in the softening tank descends

below a predetermined level the switch works to rotate the motor and automatically displace the rotary valve from the position for stopping the operation to the position for softening, and as a result, there is no fear of overflow of the softening tank to be caused by excessive supply of soft water, and a fixed amount of soft water necessary for the operation can be always secured. (Sinha-OEIS)

SEPARATOR,
Daicel, Ltd., Tokyo (Japan). (Assignee).
K. Ishii, and T. Kubo.
U.S. Patent No. 3,962,096, 4 p, 3 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 759-760, June 8, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Water pollution treatment, Water pollution control, Semipermeable membranes, *Reverse osmosis, Membrane processes, *Separation techniques.

An apparatus for separating solutes from water by a reverse osmosis process is described. A separating element is constructed by forming two layers of a semipermeable film into an envelope. A lining capable of allowing the passage of the permeated liquid and also sufficiently rigid to support the inner surfaces of the film layers when the cleaning member is pressed against the outer surfaces is inserted between the two layers of the envelope. One end of the envelope is connected with a collecting pipe having small bores to collect the water which has passed through the semipermeable film into the internal compartment of the envelope containing the lining. The periphery of the envelope is tightly sealed. A corrugated spacer is placed on the envelope and the spacer and envelope are wound in a spiral fashion around the collecting pipe. The ridges and grooves of the spacer define channels which extend parallel to the longitudinal axis of the collecting pipe. The opposite edges of the spacer have notches to provide communication between adjacent channels so that the water to be treated, as well as objects for cleaning the film, can move from one channel to the next in series. The tubular separating element or cartridge thus obtained is placed in a pressure vessel. (Sinha-OEIS)
W76-13148

SYSTEM OF WATER PURIFICATION AND PRODUCT DISTRIBUTION,
C. W. Gossett, and W. J. Dauenhauer.
U. S. Patent No. 3,963,612, 4 p, 7 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 947, No 3, p 1262, June 15, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Reverse osmosis, *Domestic water, Hydraulic properties, Reservoirs.

A system of water purification and distribution employs a movable mounted reverse osmosis module that moves in response to the hydraulic pressure differential created on opposite sides of it during the operation of the system. It is especially devised for home use. A vessel having a relatively large interior chamber for housing the principal components has an inlet connected with a conventional water service line as well as an outlet for discharging nearly pure product water. A stationary upright cylinder secured to the bottom of the vessel and a reciprocable reverse osmosis module are within the chamber. The hydraulic differential pressure on the opposite sides of the chamber controls the supply of raw water from the water service line. A cup reservoir connected to the outlet of the reverse osmosis module holds a replenishable supply of nearly pure product water and is connected to a valve-controlled water distribution line. (Sinha - OEIS)

NOVEL POLYMER MEMBRANES FOR REVERSE OSMOSIS,
Babcock and Wilcox ltd., London (England). (Assignee).
W. M. Muir.
U. S. Patent No. 3,963,618, 8 p, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 3, p 1264, June 15, 1976.

Descriptors: *Patents, *Water purification, *Membranes, *Reverse osmosis, Osmosis, Membrane processes, Organic compounds, Filtration, Separation techniques, Resins.
Identifiers: Polyvinyl co-acetal resin, Ultra-filtration.

A series of organic polymers are described which, when cast in the form of membranes, are useful in the fields of osmosis, reverse osmosis, ultra-filtration and related techniques. In different aspects the invention includes the new polymers and methods of making them, membranes incorporating the polymers and methods for making them, apparatus utilising the new membranes for liquid purification and separation, and methods of so treating liquids. In general as thin a membrane as possible is produced which still has sufficient mechanical strength to be usable. Further variations can be made in the casting technique to vary the structures of the membranes. Membranes produced by the methods of this invention can be incorporated into standard modules or appartus for water purification. Osmotic pressure can be very high and so for reverse osmosis applications and hyperfiltration under pressure, the membrane needs to be supported on a rigid porous matrix. (Sinha-OEIS)

PRESENCE OF INSECTICIDES IN SURFACE WATERS AFTER CONDITIONING TREATMENT, (IN ITALIAN),
Camerino Univ. (Italy). Istituto di Igiene.
M. G. Pellegrini, and M. Cocchioni.
Boll Soc Ital Biol Sper. 50(15), p 1138-1142, 1974(1975).

Descriptors: *Water pollution sources, Italy, *Artificial lakes, Lakes, *Surface waters, *Insecticides, *Flocculation, *Water pollution treatment, *Water purification, Filtration, Chlorination, Potable water, Analytical techniques, Gas chromatography, DDD, DDE, DDT, Dieldrin.

Surface waters from a man-made lake in the district of Marche, Italy, are purified by flocculation with aluminum sulfate, filtration and chlorination, resulting in almost total bacterial removal, efficiently reducing organic material and generating potable water. Gas chromatography was used to determine Lindane, Heptachlor epoxide, p,p'-DDE, Dieldrin, p,p'-DDD and p,p'-DDT in the waters before and after passage through the purification plants. The insecticides increased in the raw river water in July and Oct. (probably because increased rainfall washed insecticide from the soil). The purification plant reduced insecticides considerably particularly when the water was most turbid. Typical figures in micrograms per liter are DDT 0.042 and 0.10; Dieldrin 0.0197 and 0.117; Lindane 0.0138 and 0.0050.--Copyright 1976, Biological Abstracts, Inc.

DETERMINATION OF SODIUM FORM WATE SOFTENER BREAKTHROUGH,
Beckman Instruments, Inc., Fullerton, Cal (Assignee).
D. M. Chisdes.
U.S. Patent No. 3,964,999, 4 p, 2 fig, 6 ref; Offici Gazette of the United States Patent Office, V 947, No 4, p 1723, June 22, 1976.

Descriptors: *Patents, *Water quality contr *Water treatment, *Water purification, Water so tening, Demineralization, Ion exchange, Har ness(Water), Conductivity, Reverse osmos *Ions, *Pollutant identification.
Identifiers: Divalent ions, Monovalent ions, So um ions.

In water softening, utilizing the zeolite or i exchange process, divalent or hardness, calciu and magnesium ions are replaced by monoval ions. In the case of a sodium form water softe the hardness ions are replaced by sodium io This leaves a product water or outflow from t water softener that has a very slight conductiv difference from the hard water feed. The inventi provides a system for detecting exhaustion of water softener and controlling the regenerati which does not depend upon a high degree of s sitivity in the measurement of product conducti ty. The softened water product or outflow is s jected to means for discriminating betwe monovalent and divalent ions. This is done by d ferentially rejecting monovalent and divalent io from the product water by means of a reverse mosis unit. Conductivity is measured both bef and after the product has flowed through t reverse osmosis unit and the two conductiviti are compared. When the water softener b become exhausted the difference between the t conductivities becomes much greater. (Sinh OEIS)

OPTIMAL DESIGN OF CHLORINATIO SYSTEMS,
Malviya Regional Engineering Coll., Jaip (India).
M. L. Tikhe.
Journal of the Environmental Engineering Di sion, Proceedings of the American Society of Ci Engineers, Vol 102, No EE5, p 1019-1028, Octob 1976. 7 fig, 1 tab, 12 ref.

Descriptors: *Water pollution control, *Wa water(Pollution), *Mathematical mode *Chlorination, Environmental engineering, O timization, Costs, Organic compounds, Tim Economics, Equations, Systems analysis.
Identifiers: *Chlorine compounds, Contacti *Cost minimization.

A mathematical model has been developed to c culate the chlorine dose required for a desired p centage kill of organisms while keeping the to cost of the process at minimum. The mo developed is general and applicable for water well as wastewater. An example has been work out to illustrate the use of equations proposed. T optimum chlorine dose is not only a function various constants and cost of chlorine but also t volume to be treated. The optimal cost of chlorin tion increases with the increase in percentage k of organisms. (Bell-Cornell)

ailable from the National Technical Informa- Service, Springfield, VA 22161, as NL/TM-5258, $5.50 in paper copy, $3.00 in crofiche. Report ORNL/TM-5258, March 1976, p, 9 fig, 6 tab, 4 ref, 3 append. W-7405-eng-26.

scriptors: Hydrology, *Model studies, drologic data, *Separation techniques, *Water lity, *Hydrographs, *Water quality standards, gions.

e of the hydrograph separation methods which evaluated was the quick-flow method eloped at Coweeta Hydrologic Laboratory. s method assumes that quick flow may be arated from delayed flow by a straight line of trary slope. The second method uses rainfall to define storm events and then separates nflow from baseflow by projecting a baseflow ession curve during the storm event. The two hods were evaluated on their conceptual basis, e of application, cost of data processing, and eptability of results. On the basis of this luation, the quick flow method was favored for in regional assessment. (Chilton-ORNL)

TRITIUM EFFLUENT CONTROL PROJECT, PROGRESS REPORT: OCTOBER - DECEMBER 1974,
Mound Lab., Miamisburg, Ohio.
C. J. Kershner.
MLM-2217, August 1975, 23 p, 3 tab, 6 fig, 21 ref. E-33-1-GEN-53.

Descriptors: Reviews, *Tritium, *Control systems, Effluents, *Waste treatment, Pollution abatement, Treatment facilities.

A progress report is presented for the tritium emission control effort initiated at Mound Laboratory in 1972. The installation of a pilot scale cryogenic adsorbate separation system is reported to have progressed beyond 50% completion. Hydrogen gettering is being investigated and it was found that HIP alloy sorption capacity at room temperature was 2.2 wt. %. HIP alloy preferentially sorbs hydrogen in the presence of air. The possibilities of tritium decontamination by molecular excitation were investigated. Selective photodissociation of HTO in the presence of hydrogen was the best scheme for tritium removal. Three additional organic materials, dimethylformamide, dimethylacetamide, and ethoxyethylacetate, were evaluated for use in an extractive distillation system. A computer program has been developed for calculating operating and design parameters for catalytic exchange enrichment and stripping of tritiated water. (Chilton-ORNL(

ECONOMIC EVALUATION OF THE PROMULGATED INTERIM PRIMARY DRINKING WATER REGULATIONS,
Energy Resources Co., Inc., Cambridge, Mass.
J. E. Alpert, and D. Harrington.
Available from the National Technical Information Service, Springfield VA 22161 as PB-248 588, $9.25 in paper copy, $3.00 in microfiche. Report No. EPA-570/9-75-003, October 1975. 276 p, 4 fig, 70 tab, 73 ref, 8 append. EPA No. 68-01-2865.

Descriptors: Evaluation, *Water treatment, *Costs, *Economics, Unit costs, Potable water, Monitoring, *Regulation, Water costs, Water supply, Annual costs, Cost comparisons, Cost analysis, Municipal water, *Water quality standards.
Identifiers: *Drinking water regulations.

An evaluation was performed of the Promulgated Interim Primary Drinking Water Regulations. The results of this study indicated the following: The annual costs for water monitoring for community systems will be between $12 million and $25 million, while the costs for water monitoring for non-community systems will be between $4.5 million and $9.5 million. Between $1.1 billion and $1.8 billion will be required to build additional treatment facilities for removing contaminants from the nation's drinking waters. It will cost $263 million per year for operation and maintenance of these required facilities. The annual per capita costs for those systems which will require treatment range from $240 for a system serving 25 people and treating for heavy metal removal to under $0.25 per year for systems serving over 100,000 people requiring disinfection. A constraint analysis examined the broad area of chemicals and supplies, manpower, laboratories, and engineering and construction services. (Humphreys-ISWS)

ECONOMIC EVALUATION OF THE PROPOSED INTERIM PRIMARY DRINKING WATER REGULATIONS,
Energy Resources Co., Inc., Cambridge, Mass.
J. E. Alpert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 587, $11.00 in paper copy, $3.00 in microfiche. Report No. EPA-570/9-75-002, October 1975. 397 p, 12 fig, 140 tab, 72 ref. 11 append. EPA No. 68-01-2865.

Descriptors: *Evaluation, *Water treatment, *Costs, *Economics, Unit costs, Potable water, Monitoring, *Regulation, Water costs, Water supply, Annual costs, Cost comparisons, Cost analysis, Municipal water, *Water quality standards
Identifiers: *Drinking water regulations.

An economic evaluation was performed of the Proposed Interim Primary Drinking Water Regulations as published in the March 14, 1975, Federal Register. The results of this study indicated the following: The annual costs for water monitoring for community system would be between $22 and $43 million, while the costs for water monitoring for non-community systems would be between $47 million and $92 million if the proposed regulations were adopted. A cost of between $1.1 billion and $1.8 billion would be required to build treatment facilities to remove contaminants from the nation's drinking waters. It would cost an additional $282 million per year to operate and maintain the required treatment plants. The annual per capita costs for those systems which would require treatment would range from $244 for a system serving 25 people and treating for heavy metal removal to $0.25 per year for systems serving over 100,000 people requiring disinfection. A constraint analysis examined the broad areas of chemicals and supplies, manpower, laboratories, and engineering and construction services. (Humphreys-ISWS)

URBAN RUNOFF POLLUTION CONTROL PROGRAM OVERVIEW: FY'76,
Municipal Environmental Research Lab., Edison, N. J. Storm and Combined Sewer Section.
R. Field, A. N. Tafuri, and H. Masters.
Report EPA-600/2-76-095, March, 1976. 67 p, 15 fig, 11 tab.

Descriptors: *Waste water treatment, *Waste treatment, *Sewage treatment, *Runoff, *Waste water(Pollution), Water pollution control, Sewage, Water quality, Hydrology, Combined sewers.

The basic technical and administrative problems associated with urban runoff and the approach of the Environmental Protection Agency's (EPA) research and development program to combat these problems are reviewed. Information on flood control, erosion control and the basic pollutional problems created by wet weather flows is presented. Nationwide cost requirements for abating urban runoff pollution and available abatement technology are discussed. Of overlying importance, program direction and desired goals are cited with intent towards a truer concept of solution methodology involving receiving stream impact analyses. Details of technologic advancements resulting from some 150 research and development projects are summarized. Both nonstructural and structural control are included. The problem is divided into the categories of problem definition, user assistance tools, land management, collection system control, storage, treatment, sludge/solids, integrated systems, and technical assistance/technology transfer. General cost comparisons are made for urban runoff pollution control/treatment. A cost-effective solution for urban runoff pollution control by in-line storage in Seattle, Washington, and a simplified hypothetical plan for wet-weather flow pollution abatement for the Des Moines, Iowa, area are given. Identifiers: *Tioga County(Penn), *Surface mine reclamation.

A mine drainage abatement demonstration project for a mined area in the vicinity of Morris Run Village in Tioga County, Pennsylvania was determined to be feasible. The primary objective of the project is to demonstrate the effectiveness of various preventive measures in eliminating or reducing acid mine drainage discharges. The recommended project includes demonstrating effective techniques for mine drainage abatement, reducing a specific mine drainage problem, and restoring portions of a mined area to their approximate original surface grade. The project calls for the restoration of two strip mines; agricultural limestone will be used to establish vegetation in one and sewage sludge to establish vegetation in the other. The mine to be restored using sewage sludge covers 60 acres. Spoil piles will be used for fill. The site will be restored to its original grade, and holding or infiltration ditches will be constructed immediately downhill from the test plot. Three inches of sewage sludge will be placed on a 4.3-acre test plot and scarified into the top cover. The appropriate amount of grass seed will then be placed on the test plot. It is estimated that implementation of the project will result in a reduction of 8,480 lbs per day of acid under average groundwater conditions. Significant reductions in high flows and loadings are expected from mine drainage discharges during and immediately after precipitation. It is estimated that preventing the runoff from a one-inch 24-hour rainfall from entering the interconnected deep mines will result in a reduction of 63,200 lbs of acid. These reductions should cause an improvement in river water quality. (Snyder-FIRL)

EXAMPLE FOR REGIONAL PLANNING OF WATER QUALITY IN DENMARK (BEISPIEL EINER REGIONALEN PLANUNG DER GEWAESSERQUALITAET IN DAENEMARK),
G. Posselt.
Forum Umwelt Hygiene, Vol. 27, No. 5, p 160-164, 1976. 1 fig, 2 tab, 6 ref.

Descriptors: *Planning, *Water quality, Europe, Streams, *Watersheds(Basins), Sewerage, Human population, Water demand, Evaluation, Costs, *Regional analysis, Regions.
Identifiers: *Saprobic levels, *Denmark.

A simple scheme for water quality planning in a given region of Denmark uses the classes of the saprobic system. An analysis of the fundamental physical factors for water quality in nearby areas at streams of the region's drainage basins is the plan's basis. This analysis determines the best possible saprobic level after eliminating all known sewage discharges in the area. The next step is a statement of human demands regarding activities at or near watercourses. Dialogue with local associations, municipal organizations, and others interested in sufficient water supplies is necessary. The temporary water quality goal can be defined by comparison of the basic saprobic level, expressing the physical influence of the surroundings, with that level of saprobity which is assumed to assure the various needs of the population. The necessary measures are then drafted. The plan's feasibility is then determined by evaluating the probable costs. (Snyder-FIRL)

ESTIMATES OF SOCIO-ECONOM DAMAGES OF AN OIL SPILL,
Institute for Water and Air Pollution Resear Stockholm (Sweden).
I. Rosenblum, and A. Jernelov.
IVL (Institutet for Vatten- och Luftva sforskning) Publication No. B 264, Decem 1975. 23 p. 5 tab., 3 ref.

Descriptors: *Oil spills, *Social impa *Economic impact, Damages, Fisheries, Oil po tion.
Identifiers: Guatemala, *Caribbean Sea, Livi ston(Guatemala).

The impact of an oil spill in the Caribbean Sea the Guatemala coast on April 1975 was evalua as to the probable duration of its effects and an sessment of the economic losses involved. The sidents of the town of Livingston and along coast up to the border of Belice at Sarstun Riv British Honduras, were interviewed to determ the importance of the fishery to the local popu tion; the extent and type of damage, and economic and social implications. The invent of damages included direct damages in finan losses borne by the fishermen due to disruption their fishing avtivities, reduced catch, equipm damages. Indirect damages were cost due to fish consumption of the fishermen and their pendents; and lost income of the petty fish tra An additional decrease in the catch, although te porary, may result in an accelerating abandonm of fishing which may cause further improveri ment, increased migration to already overpo lated urban areas offering little employment; an further disruption of the society. The bulk of damage constitued financial losses to 43% of population in the communities due to the interr tion of the fishing activities for an average of days and reduced catch for 75 days after the spill occurred. (Auen-Wisconsin).

DOES WATER USE RESTRICT THE LOC TION OF INDUSTRIAL AIR POLLUTERS,
Argonne National Lab., Ill.
D. Santini.
Water, Air, and Soil Pollution, Vol. 5, No. 2, 185-194, 1975. 1 fig., 5 tab., 6 ref. NSF(RANN) A 352 and GI 32989 A2.

Descriptors: *City planning, *Water utilizati *Sites, *Industries, *Air pollution, Pollut abatement, Illinois, Labor supply, Water supply
Identifiers: Industrial clustering.

Water use in industrial production is responsi for much of the urban clustering and consequ

llution. An added impetus toward urban in-
al concentration is the availability of a labor
y. In Illinois most particulate and sulfur
emissions are generated by industries wich
nore than 5 billion liters of water per
ishment per year, thus most industrial air
ants are emitted in urban areas which are on
bodies that supply large consistent water
es. The effectiveness of policies promoting
aphic dispersal to solve air pollution
ems will be limited by an adequate water
and the tendency of major employing,
using, air polluting industries to choose
sites. Such policies will only be effective if
ate water supplies are provided at alterna-
cations or that water use is eliminated from
oduction process. In themselves these condi-
lo not insure success. Raw material location,
quality, water for transportation, and input-
relationships between industries also in-
e clustering. The conjunction of air pollution
ndustrial water use indicates that much
attention should be given to the relation
en air and water pollution with some study
possibility of substitution of one form of
on for another. (Buchanan-Davidson--
nsin).

LOSSES OF NITROGEN IN SURFACE RUNOFF IN THE BLACKLAND PRAIRIE OF TEXAS,
Texas Agricultural Experiment Station, College Station.
D. E. Kissel, C. W. Richardson, and E. Burnett.
Journal of Environmental Quality, Vol. 5, No. 3, p 288-293, July-September 1976. 1 fig, 4 tab, 16 ref.

Descriptors: Nitrogen, Nitrates, *Nutrient removal, Texas, *Surface runoff, *Nitrogen compounds, Agricultural watersheds, Fertilizers, Nitrites, Leaching, Water pollution sources, Water quality, Agricultural runoff, Soil erosion, Water pollution, Nutrients, Organic matter, Runoff, Analytical techniques, Watersheds(Basins), Grain sorghum, Cotton, Oats.
Identifiers: *Nitrogen losses, *Texas Blackland Prairie, *Fertilizer losses, *Nitrate losses, *Houston Black clay, Analytical procedures, Total nitrogen, Nitrate-N.

The objective was to determine NO3-N and total N losses in surface runoff from Houston Black clay, a swelling clay soil with a relatively low infiltration rate. The study was carried out on duplicate 4-ha watersheds cropped to a rotation of grain sorghum, cotton, and oats, all fertilized at recommended rates of N application. The loss of NO3-N varied considerably during the study, depending on events before each runoff-producing storm. Concentrations on NO3-N were usually highest just after fertilizer application when the soil was near field capacity and lowest when large amounts of water infiltrated into dry soil immediately before runoff. During runoff-producing storms just after fertilizer application, the concentrations were lowest in the initial runoff and highest near the end of the runoff event. To compute NO3-N losses with reasonable accuracy on these soils, the shape of the entire NO3-N concentration curve needed to be well defined. In general, the results of this study indicated that a small and probably insignificant amount of N is lost to surface waters when crops are fertilized at recommended N rates in the Texas Blackland Prairie. For the entire 5-year study, the mean concentration of NO3-N in runoff was 2.9 and 2.3 ppm NO3-N for the duplicate watersheds. The mean total loss of NO3-N was 3.2 kg/ha/year. Losses of sediment-associated N were about 5 kg N/ha/year. (Henley - ISWS)

VARIATION OF SUSPENDED SEDIMENT LOAD IN THE PALOUSE REGION OF THE NORTHWEST,
D. K. McCool, and R. I. Papendick.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-19, 1975, Chicago, Illinois. 20 p, 4 fig, 9 tab, 11 ref. ASAE Paper 75-2510.

Descriptors: *Suspended load, *Suspended solids, *Sediment yield, *Sediment load, *Sampling, Water quality, Return flow, Water quality control, Water pollution, Pacific Northwest US, Washington, Idaho, Oregon.
Identifiers: *Palouse River basin area(Wash-Ida-Ore).

Sediment concentrations in the Palouse small-grain dryland region of the Northwest are extremely variable on a daily, seasonal, and annual basis. Runoff events of from one to a few days in length can account for large percentages of the annual sediment discharge, and the sediment transport of a given year can be as large as the total of 4 or 5 other years. Sampling programs based on weekly samples, even at stations with excellent streamflow records, can give extremely misleading results. Sampling programs of 1 or 2 years' duration can also give extremely misleading results. If money and personnel constraints dictate a low-frequency short-duration sampling program, then it is essential that some typical portion of the study area be monitored with a high-frequency longer-duration sampling program to assess the results and for adjustment purposes. FACTORS INFLUENCING THE LOSS OF NITROGEN AND PHOSPHORUS FROM A TRACT OF IRRIGATED LAND,
Idaho Univ., Moscow. Dept. of Agricultural Engineering.
J. R. Busch, D. W. Fitzsimmons, G. C. Lewis, D. V. Naylor, and K. H. Yoo.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-18, 1975, Chicago, Illinois. 11 p, 2 fig, 4 tab, 11 ref. ASAE Paper 75-2543.

Descriptors: *Nitrogen, *Phosphorus, *Irrigation effects, Surface irrigation, Irrigation, Irrigation practices, Leaching, Nutrients, Return flow, Water pollution, *Regression analysis.

A study was conducted to identify factors that influence the loss of nitrogen and phosphorus from a tract of irrigated land. A multiple regression analysis was used to determine the influences of nine identifiable factors. The statistics of the analytical relationships obtained indicate that they are suitable for estimating the amounts of nutrients lost in surface runoff from the studied tract. The amounts of chemical constituents lost in surface runoff from a gravity irrigated farm are dependent upon several independent variables including total solids lost, amounts of nutrients applied, and water retained on the field. Specific conclusions are: (1) the amounts of nutrients in the surface runoff were significantly affected by the amounts of total solids and water lost in surface runoff, and the amounts of nutrients applied in headwaters. (2) More soluble and total phosphorus and ammonia nitrogen were lost to surface runoff in earlier irrigations than in later irrigations. (3) Increasing the percentage of applied water retained on a field and reducing the amounts of fertilizer added to irrigation water would decrease the amounts of all nitrogen forms lost in surface runoff. All results presented are applicable to the study site monitored. However, the relationships developed and conclusions drawn may be applied with caution to similar areas managed with similar cultural practices. (Skogerboe - Colorado State)

WHAT DO WE DO ABOUT THE WATER POLLUTION CONTROL ACT,
Watson and Co., Tampa, Fla. Environmental Services Div.
V. D. Patton.
Public Works, Vol 107, No 9, p 78-81, September, 1976.

Descriptors: *Water quality act, *Legislation, *Federal Water Pollution Control Act, *Water quality standards, Water pollution control, Pollution abatement.
Identifiers: *Federal Water Pollution Control Act Amendments, Legislation implementation.

The 1972 Federal Water Pollution Control Act Amendments, PL 92-500 are being reviewed in depth by many groups and individuals. This review has resulted in criticism of the constructive nature. This article is an example of the criticism offered. PL 92-500 is the most sweeping piece of legislation on water pollution control ever conceived. It is idealistic, assuming automatic compliance with unrealistic goals and deadlines by offenders and over-estimating the ability of the public to become sufficiently informed to make competent decisions by mass participation. There were no realistic estimates of the funding required to meet the greatly expanded definition of treatment works contained in the Act. An original concept fostered by some was that area wide waste management meant one treatment plant for a region covering perhaps several counties - this may require abandonment of existing plants still carrying bonded indebtedness. The provision for zero discharge is in some cases possible while forever impossible in others. Lack of uniformity in goals and lack of communications within some agencies is a real problem. Consultant selection has been complicated by recent legislative and administrative actions such as Florida's Consultant Competitive Negotiation Act. What is needed is: (1) A set of performance criteria to be established for state water pollution agencies in the area of implementation; (2) An improvement of communications between agencies and parts of agencies; (3) Maintaining the same priorities; (4) Realistic planning; (5) Less paperwork; and (6) Use of trained professionals. PUBLIC EVALUATION OF WATER QUALITY AND ITS IMPACT ON RECREATION: A CASE FROM IOWA,
Waterloo Univ., (Ontario). Dept. of Geography.
J. S. Gardner, and P. Frankland.
Institute of Urban and Regional Research, University of Iowa, Iowa City. Technical Report No. 38, December 1974. 17 p, 1 fig, 6 tab, 26 ref.

Descriptors: *Water pollution effects, *Water quality standards, *Water quality, *Recreation, *Evaluation, Aesthetics, Turbidity, Quality control, Public health, Reservoirs, Nutrients, Sediments, Social participation, Coliforms, *Iowa.
Identifiers: *Iowa River(IA), *Coralville Reservoir(IA), *Public participation.

The Iowa River and Coralville Reservoir, a multipurpose flood control project where recreation has become a major function of the project, were studied to determine the impact of water quality on the degree of participation in and enjoyment of water-based recreation. River valleys providing natural forest cover for wildlife and sites for artificial lakes are the recreational focal points in Iowa. Recent surveys indicate that at least 80% of users of the area do so because of water-based recreational opportunities. Primary purpose of the study was to find how public evaluation of water quality differed from scientific standards of water quality. Scientific standards required accepted levels of pathogenic organisms (especially fecal coliform), toxic or skin-irritating substances, and objectionable odors or floating material. However, subjective evaluations used as criteria: trash and junk, muddy water, smell, scum, foam, taste, rough fish and dead fish. Subjective evaluations of water quality discouraged participation despite water being declared safe for recreational purposes according to state standards. Fifty-seven percent of the river basin sample refused to let their children swim in river water because of its poor quality. It was found that subjective evaluation of poor water quality did not dampen enjoyment of those who do participate. (Gentry-NC)

DEVELOPMENT OF RESIDUALS MANAGEMENT STRATEGIES: AN EXECUTIVE SUMMARY,
Indiana Univ., Bloomington. School of Public and Environmental Affairs.
R. S. Howe, and N. L. White.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 011. Environmental Protection Agency, Report EPA-600/1-76-01/A, Socioeconomic Environmental Studies Series, Water Quality Guidance. 28 p, 5 fig, 3 tab. EPA-R-803313-01-1.

Descriptors: *Decision-making, *Management, *Cost allocation, *Cost sharing, *Planning, *Evaluation, Institutions, Model studies, Project planning.
Identifiers: *Residuals management, *Residuals discharge, *Environmental quality.

A residuals generation and discharge model is proposed which has the advantages of identifying different methods to achieve environmental standards, identifying and evaluating residuals management strategies (RMS), identifying at different points of residual generation and discharge when intervention with physical measures can take place. The study is designed to identify and describe means for achieving environmental quality in a fair and cost effective way, and to help decision makers find and implement residuals management programs. The planning process should determine goals and objectives, including identifying and selecting strategies for achieving goals. Such decisions require consideration of (1) factors influencing plans for the environment: the level of environmental quality desired, costs to achieve that level of quality, who pays the cost, benefits, strategies to achieve the goal, and (2) constraints on environmental management: economic, legal, political, technical, social. In selecting a strategy, a RMS combines 3 components - physical methods, implementation of physical methods, and institutional arrangements supporting implementation measures. To develop and evaluate a RMS it is necessary to (1) define the problem; (2) specify all physical methods; (3) analyze alternative physical methods; (4) identify implementation measures and institutional arrangements; (5) formulate alternative RMS; evaluate alternative RMSs, and (7) choose str for implementation. development of an on line Oil-in-Water Monitor is presented. The basic technique al scattering monitoring has been main-tained. Performance verification in various test situations was conducted. Interferences such as particulate matter, gravity, pH of water, salinity of water, and temperature of water were investigated; the only serious interference being small particulate matter. Effects of oil droplet size, detergents and type of oil on monitor performance were also investigated. At its present level of development the monitor will produce errors of less than + 10% within a single oil type at 125 ppm level. At the same level, errors less than + 14% can be expected from oil mixtures without Bunker C. Oil mixtures including Bunker C produced an error band of + 33%. (Sinha-OEIS)

PROFESSIONAL BIAS AND WATER REUSE,
George Williams Coll., Downers Grove, Ill.
J. H. Sims, and D. D. Baumann.
Economic Geography, Vol 52, No 1, p 1-10, 1976. 1 fig, 5 tab, 8 ref.

Descriptors: *Decision making, *Professional personnel, *Water reuse, *Attitudes, Psychological aspects, Potable water, Waste water treatment, Recycling.
Identifiers: Consulting engineers, Health officers.

The attitudes, feelings, and expectations of consulting engineers and public health officials toward public use of renovated wastewater were evaluated by showing them a picture of seven men attending a mayoral conference to discuss the possibility of coping with an impending water shortage by using reclaimed wastewater. They were asked to tell a story describing who the men were; what was happening; what the men were thinking, feeling, and saying; and how they thought the situation would turn out. The results revealed orientations based on their initial attitudes toward such a proposal, perceptions of problems which might be encountered, personal concerns, and professional position. Health officials were more negative: they resisted the idea, raised many major objections, and their reflection strengthened their antagonism. Consulting engineers had a more favorable attitude at first, raised fewer objections, and were divided between endorsement or rejection. This projective technique showed the nature and strength of professional support and resistance to water reuse. The responses reflected professional expertise and bias. The psychological bias inherent in professional experts and the full range of its implications in the formulation and implementation of public policy on environmental issues needs to be identified. (Buchanan-Davidson--Wisconsin)

THE BUDDING ENVIRONMENTAL CLEAN-UP (A VIEWPOINT): PART II. CLEAN UP, COSTS AND GROWTH,
Northeastern Illinois Univ., Chicago. Dept. of Earth Sciences.
R. H. Charlier, and M. Vigneaux.
International Journal of Environmental Studies, Vol 8, No 1, p 121-136, 1975. 71 ref.

Descriptors: *Attitudes, *Industrial production, *Pollution abatement, *Environmental sanitation, Foreign countries, United States, Waste disposal, Water pollution, Air pollution, Legislation, Costs, Penalties(Legal), Oceans, Economics.
Identifiers: *Environmental protection, *Economic growth.

There is world-wide concern about environmental deterioration. Earth Day 1970 aroused public interest in some of the major areas of concern and stimulated some excellent programs, but lacked impetus. Some of the environmental protection efforts which have been started in the United States, France, and other countries are described. Water and air pollution are very acute problems in many parts of the world, but corrective actions have been piecemeal, sporadic, and uncoordinated. A national and international policy which would conserve and protect our natural resources is needed. Legislation is a step in the right direction, but too often enforcement is lacking. Developments to prevent pollution by petroleum products are described. Various methods have also been developed to handle garbage. At a meeting of representatives from 91 nations, a list of substances which should not be dumped into the ocean was developed, but the group lacks the force of law. Also there is the conflict between environmental protection and economic growth. (Buchanan-Davidson--Wisconsin)

U.S. Patent No. 3,962,083, 4 p, 9 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 947, No 2, p 755, June 8, 1976.

Descriptors: *Patents, *Oil spills, *Oil pollution, Coasts, Beaches, Shores, Water pollution, Absorption, Plastics, Mechanical equipment.
Identifiers: Amphibious vehicles, Oil-absorbing web.

A method and apparatus is described to protect the shoreline from contamination due to the deposit of oil from an oil spill on adjacent waters. A protective oil-absorbing blanket or web is laid on the shoreline, preferably in anticipation of the arrival of an oil spill. The web-laying vehicle includes a body which is watertight and which is mounted on six wheels having relatively soft tires. This all-terrain vehicle which is amphibious has a suitable frame for supporting a coiled web and for guiding the web onto the shoreline as the vehicle moves along. The vehicle also has the means for loading the web back onto it and means for extracting the oil. The web may be fabricated from two layers of cellulose fibers supported on an intermediate scrim or a heavy molded plastic netting confining shredded polyolifins. (Sinha-OEIS)
W76-13144

RETRIEVAL MEANS FOR A FLOATING LIQUID SPILLING,
W. P. Kirk, and D. W. Reynolds.
U. S. Patent No. 3,963,617, 4 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 947, No 3, p 1264, June 15, 1976.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution control, Water pollution, Pollution abatement.
Identifiers: Oil slicks.

An apparatus for recovering floating liquids is comprised of a sheet with a weighted periphery. The sheet is deployed by use of explosives which spreads the sheet horizontally over the liquid surface, after which the periphery submerges, confining and centrally concentrating the floating oil. In addition to the weights, the flexible sheet is provided with flotation and vent means to provide buoyancy and to facilitate the venting of air entrapped between the sheet and the spill during deployment. A line is secured to the weights at the edge of the sheet and passes through a loop on the opposite edge which tends to pull the edges of the sheet together thereby assisting in collapsing the structure. The line is also provided with an additional length to form a tow line. (Sinha-OEIS)
W76-13152

METHOD OF REMOVING MATERIAL FROM A BED OF A BODY OF WATER,
T. A. Mathieu.
U. S. Patent No. 3,964,184, 4 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 947, No 4, p 1458, June 22, 1976.

Descriptors: *Patents, *Water pollution, *Water quality control, Bodies of water, Water pollution sources, Mine wastes, Hydraulic equipment, Turbulence, Fluid mechanics, Dredging.
Identifiers: Barite, 'Mud pits'.

A method is provided for removing material, such as cuttings and barite from bodies of water such as so-called mud pits which are simply ponds, lakes or like bodies of water whose beds are covered by the material which is to be removed. However, since the material is rather dense due to having settled to the bottom, the method includes utilization of a floating hull such as a platform from which water is drawn from the body of water close to its upper surface. The drawn water is formed into generally parallel pressurized streams inclined to the horizontal and directed rearward from the stern of the hull and released at points substantially removed from and generally equidistant from the hull and adjacent to the material for creating a turbulence and admixing the material and water. Then the material-water admixture is collectively withdrawn and disposed of. The water is picked up relatively particle free during initial operation of the barge. The primary key to achieving the turbulence or jetting action is the fluid velocity and not pressure. The more gallons pumped through the jets, the quicker the particles will combine with the water to form the material-water (slurry) admixture. (Sinha-OEIS)

DEVELOPMENT AND APPLICATION OF A WATER RESOURCE ALLOCATION MODEL,
Engineering-Science, Inc., Berkeley, Calif.
W. O. Maddaus, and J. M. McGill.
Water Resources Research, Vol. 12, No. 4, p 767-774, August 1976. 3 fig, 8 ref.

Descriptors: *Water resources development, *Water allocation(Policy), *Water supply, *Water quality control, *Alternative planning, *Waste water(Pollution), *Management, Water demand, Constraints, Water policy, *Groundwater, Environment, Reservoirs, Arizona, Regions, Digital computers, Mathematical models, Optimization, Systems analysis.
Identifiers: Cost minimization, Cost effective, *Tucson(Arizona).

A water resource optimization model is described for use in long-range infrastructure planning for water supply and waste water management. The model includes a network analyzer to determine least-cost allocation of available sources of water supply (including reclaimed waste water) to various demand points subject to certain physical constraints and water management policies, a recosting procedure for nonlinear cost functions, a digital groundwater model for simulating widespread changes in groundwater depth, and a salt balance model for simulating groundwater quality changes with time. The modeling system provides costs for the optimal water resource allocation for various sets of constraints as well as the environmental changes in the groundwater reservoir, as represented by the number of years until groundwater levels fall to 76 m below 1970 levels and quality of the supply. The most cost-effective alternative has been identified and used to develop a 50-year water supply and waste water management plan for the Tucson Arizona regional area. The least-cost alternative is identified as the serving of all projected water needs from groundwater sources and augmenting the groundwater in the northern portion of the study area by recharing with reclaimed water along the Rillito River. REMOVAL OF TRACE ELEMENTS BY THE DNESTR RIVER, (IN RUSSIAN),
Y. V. Bumbu.
Izv Akad Nauk Mold SSR Ser Biol Khim Nauk. 4, p 59-62, 1973.

Descriptors: *Trace elements, Rivers, Absorptions, Aquatic animals, Maganese, Zinc, Copper, Cobalt, Iodine.
Identifiers: Dnester River(USSR).

The results of a 2-yr study of the content and removal of trace elements by the Dnestr River (USSR) are presented. In the Dnestr the content of such biologically active and vitally necessary elements as I and Co is 3-4 times less than the less active elements Cu, Zn and Mn. The levels of trace elements in the river and their removal can be arranged in the descending order Mn-Zn-Cu-Co-I. The minimum level of trace elements and their removal by the river occurred in July. This is attributed to their increased utilization by aquatic organisms and absorption by suspended organic and mineral particles and mud.–Copyright 1975, Biological Abstracts, Inc.

CONSERVATION: EESG BIBLIOGRAPHY SERIES:16,
Reading Univ. (England). Dept. of Economics.
M. J. Stabler.
EESG (Environmental Economics Study Group) Bibliography Series 16, February 1975. 19 p. 216 ref.

Descriptors: *Bibliographies, *Conservation, *Natural resources, *Exploitation, *Economic justification, *Cost-benefit analysis, Social aspects, Industrial production, Projections, Energy, Welfare(Economics), Decision making, Legal aspects, Economic rent, Environment, Pollutants, Marine fisheries, Public rights, Evaluation.
Identifiers: *Public policy.

The scope and nature of economic analysis of conservation of stock resources, amnity resources, the aspects of costs and effects of pollution, the preservation of wildlife and natural scenery, and the social costs of economic growth are reflected in 216 citations. The added dimension considered is the relationship between growth and environmental quality and the problem of conservation concerned with depletion of natural resources in connection with the energy crisis. Discussions evaluate the precise definition of conservation, its boundaries, and the interpretation of the intertemporal use of natural resources from an economic standpoint, decisions on the rate of utilization of resources, such as aspects of soil conservation, fishery, energy resources, pollution, ecology, and the quality of the environment, as well as the spatial analysis of conservation. Also covered is the concern for conservation of resources not only related to the problem of rate of utilization but where property rights are not clearly, or cannot be, defined, as for instance the fishery industry where the nature of the common property, the freedom of entry, and the dissipation of economic rent as a consequence of overutilization. Several citations discuss implicit and implied guidelines for public policy. (Auen-Wisconsin)

A CLUSTER ANALYSIS OF ACTIVITY, FREQUENCY, AND ENVIRONMENT VARIABLES TO IDENTIFY WATER-BASED RECREATION TYPES,
Wisconsin Univ., Green Bay. Urban Analysis.
R. B. Ditton, T. L. Goodale, and P. K. Johnsen.
Journal of Leisure Research, Vol. 7, No. 4, p. 282-295, 1975. 3 fig., 1 tab., 18 ref.

Descriptors: *Recreation demand, *Analytical techniques, *Water users, Behavior, Recreation, Wisconsin, Great lakes, Spatial distribution, Statistical methods, Camping, Hunting, Swimming, Fishing, Water skiing, Boating, Water sports.
Identifiers: *Recreation typology, *Cluster analysis, Picnicking, Sailing.

Cluster analyses were used to establish relationships among individuals as determined by their recreation participation measurements, utilizing a sample of 250 of 2174 heads of households surveyed in northeastern Wisconsin. The first analysis identified eight mutually exclusive clusters of individuals, distinguished by the kind and frequency of their water-based recreation activity. The second analysis based on kind, frequency, and type of environment yielded nine clusters. Inclusion of the location variable added an important dimension to these analyses. Results suggest that in terms of distinguishing behavior, individuals may first relate to environments and choose activities secondarily. Large water bodies like the Great Lakes do not appear to be distinctive attractors of water-based activity for populations when other alternatives exist and the travel dimension is relatively constant. A large minority of clusters were distinguished by participation in open water environments, but the sheer size of these resources as well as their intensive access and facility development programs have not led to noticeable shifts in participation. Excluding distance concerns, other factors relating to means and access, such as cost and durability of equipment needed, weather, and seasonality, are involved in recreation choices. (Luedtke-Wisconsin)
W76-12955

BENEFITS OF AN EXTENDED SEASON: THE EXPERIENCES OF ONE INDUSTRIAL USER,
C. H. Boyd
Seaway Review, Vol. 5, No. 2, p. 15-17, 1975.

Descriptors: *Navigation, *St. Lawrence Seaway, *Great Lakes, *Winter, *Economic impact, Monetary benefits, Indirect benefits.

The Dow Chemical Company moved 20% of its 900,000 tons of product in 1974 through the Great Lakes-St. Lawrence Seaway system. Water transportation moves larger tonnages of product with more efficient fuel consumption and less environmental disturbance. Continued extension of the seaway season would conserve fuel and reduce capital expenditures. A 10-month season would eliminate the need for a $5.7 million increase in storage capacities for the next three years. This money could be redirected toward plant expansion, thus creating new jobs and helping the economy. In 1974 Dow needed to deliver caustic soda to Thorold and Thunder Bay, which had low inventories. Alternate means of delivery would have increased shipping costs, and carrier equipment was difficult to acquire. Overland transportation would have cost $600,000, water transportation only $300,000. Therefore Dow is encouraging its Canadian customers to use storage facilities to take the product directly by water in the future. An extended navigation season can exert real anti-inflationary pressures on the economy. Based on the experiences of keeping the seaway open longer in 1974, Dow wants to keep a ship operational during the 1975 winter season and will help overcome problems in order to extend the season. HOW SRI LANKA PLANS TO DEVELOP HER FISHING INDUSTRY,
T. Drieberg.
Fishing News International, Vol. 14, No. 10, p. 14-16, 1975.

Descriptors: *Commercial fishing, *Asia, *Indian Ocean, Fishing gear, Fish harvest, Financing,

Boats, Foreign trade, Training, Harbors, Refrigeration, Nets, Fish handling facilities, Aquiculture.
Identifiers: *Sri Lanka(Ceylon), Fishing fleet.

Sri Lanka is developing inland and marine offshore fisheries to help meet threatened protein shortages. The Department of Fisheries was established with regulatory and development responsibilities. The present catch is largely from coastal fishing, some from inland fishing, with little deepsea fishing. The boats used cannot operate in the 30-60 mile offshore range; there is a lack of private-sector enterprises to fish in this range; import of suitable boats is prevented by shortage of foreign exchang; and there is a scarcity of trained crews. Consultants have studied local conditions and developed boat designs which eliminate defects of previous boats. Two banks will extend credit to prospective buyers. The government is providing equipment for boat repairs. A new boat will have to be designed for skipjack fishing. Due to lack of foreign exchange, other supply avenues for obtaining trawlers are being investigated, such as joint ventures with foreign companies. Centers for training coastal fishermen, developing fish product markets, and research are being established. Harbors are being developed, refrigeration facilities increased, fishing nets manufactured, and shrimp and beche-de-mer processing plants opened. Inland fisheries are being encouraged and new fish species introduced. China and other countries are furnishing technical aid. (Buchanan-Davidson--Wisconsin)

PLANNING FOR WATER RECREATION IN ISRAEL,
Technion-Israel Inst., of Tech., Haifa. Center for Urban and Regional Studies.
V. Kenyon, and R. Enis.
Landscape Planning, Vol. 2, No. 1, p. 45-62, 1975. 6 fig., 6 tab.

Descriptors: *Planning, *Recreation, *Water resources development, Multiple-purpose projects, Sites, Recreation facilities, Foreign countries, Lakes, Lake shores, Springs, Landscaping, Rivers, Beaches, Reclaimed water, Land uses, Water quality.
Identifiers: *Israel, Lake Kinneret(Israel), Sachne Springs(Israel), Hadera River(Israel), Dan Regional Sewage Scheme(Israel), Sequential water use.

Growing demand for outdoor recreation has placed heavy pressure on the limited water recreational sites in Israel. Its inland water resources are analyzed for their potential to meet the requirements of different recreational activities. Recreational water use is characterized by the different types of demands upon it as well as by relevant aesthetic and safety factors. Four different types of water resources are considered: water bodies or lakes, springs, rivers, and treated effluents. A planning approach utilizing one of three solutions, (a) multiple use of water, (b) sequential use of water, and (c) rationalization of land uses along water edges is illustrated. Specific cases described are lake Kinneret, which poses conflicting land and water use problems; Sachne, a sequential use of a spring; Nahal Hadera, the problem of the reorganization of a badly polluted river basin; and Dan Regional Sewage Scheme, the multiple use of improved effluent during the treatment process. It is proposed to integrate water based recreation areas into the national water planning system, developed primarily for agricultural, industrial, and domestic water supply, in order to evaluate alternative recreation sites and water projects throughout the country. (Luedtke-Wisconsin)
W76-12959

SOLAR SEA POWER,
Carnegie-Mellon Univ., Pittsburgh, Pa.
C. Zener.
Bulletin of the Atomic Scientists, Vol. 32, No. 1, p. 17-24, 1976. 3 fig., 2 tab., 20 ref.

Descriptors: *Oceans, *Energy conversion, *Electric power production, Tropic, *Solar radiation, Feasibility studies, Economic feasibility, Design.
Identifiers: *Ocean thermal energy conversion.

The feasibility, efficiency, costs and climatic effects of ocean thermal energy conversion (OTEC) to electric power are discussed. A 300 ft diameter design (illustrated) would have an approximate capacity of 100 MW, or one-tenth the capacity of a nuclear or fossil fuel power plant. A network over the entire tropical ocean could supply the world's population in the year 2000 with per capita energy now consumed by the U.S. The operation of such systems is dependent, however, on costs, potential alternative uses of ocean surface, and environmental impacts. A design of an OTEC, using ammonia circulated in a closed cycle, has been found both technically feasible and economically attractive. An alternate concept of an open cycle OTEC is also being investigated. Estimates of an OTEC plant (in 1975 dollars) based on current technology, show cost at $2100/KW as compared to $800 of nuclear cost. Advances in evaporator, condenser, pumps and pipes, etc., are expected to reduce the baseline costs of these components to about $450 from $1100, before optimization. Reoptimization of the components would further cut costs to $450/KW hour. Potential cost reductions also exist in appropriate site selection. An 25 MW module could be built and tested by 1981. (Auen-Wisconsin).

ENVIRONMENT AND SOCIAL CLASS, EESG BIBLIOGRAPHY SERIES 15.
Bristol Univ. (England). Dept. of Economics.
EESG (Environmental Economics Study Group) Bibliography Series 15, (undated). 3 p. 39 ref.

Descriptors: *Bibliographies, *Environment, *Income distribution, *Social aspects, Economics, Industrial production, Economic efficiency, Equity, Attitudes, Welfare(Economics), Air pollution, Social values, Urban sociology.
Identifiers: *Public policy, Noise pollution.

The general aspects of environmental protection as related to income distribution are discussed in 39 citations. Related discussions deal with the effects of economic growth, economic issues in planning urban recreation facilities, social class attitudes to air, noise, and water pollution, and congestion vs. welfare. The theory on choosing policies to reconcile distribution and allocation objectives making explicit use of a social welfare function, and the efficiency and equity in national resource and environmental policy are also cited. Industrial growth, the costs of growth, and a review of possible treatments of income distribution in cost-benefit analysis, are among the pertinent subjects. (Auen-Wisconsin)

WISCONSIN ANNUAL REPORT 1975,
Upper Great Lakes Regional Commission, Madison, Wis.
P. J. Lucey.
(1976), 76 p.

Descriptors: *Wisconsin, *Interstate commissions, *Regional development, Transportation, Mining, Financing, Employment, Agricultural runoff, water pollution control, Waste treatment, Cattle, Fisheries, *Great Lakes Region, Marketing, Forest management, Training, Recreation, Grants, Future planning(Projected).

The economic development through technical assistance and supplemental grants implemented by the Wisconsin Office of the Upper Great Lakes Regional Commission in the 36-county region of northern and central Wisconsin is described. S repesentative projects were the development dustrial parks and improvements to existing in trial areas such as water and sewer improvem It is estimated that these improvements will r in 2200 to 2300 new jobs and help retain an tional 300 to 400 jobs over the next three or years. The Commission also supports busines management consulting services. Financia was provided for Wisconsin Railroads, air t portation and selected bridge projects to aid i try and passenger service. Demonstration pro in soil conservation practices to reduce ag tural runoff, farm waste management, and a vey of ore deposits were conducted. A dairy program demonstrates farm management, ma ing, and increased production. Commercial fi men were assisted by a project to increase u certain fish species and better means of uti fish wastes, management, and marketing. F management information is disseminated as as the promotion of recreation and tourism goals for the next three-year plan are desc and funding requirements are indicated. (A Wisconsin).

IMPACTS OF RECREATIONAL DEVE MENT: THE VOYAGER VILLAGE PERIENCE,
Wisconsin Planning Office, Madison.
C. Deknatel.
February 1975. 14 p. 6 fig.

Descriptors: *Community develop *Recreation, *Lake shores, Planning, S tanks, *Wisconsin, Rural areas, Local go ments, Land use, Zoning, Economic impact vironmental effects.
Identifiers: *Voyager Village(Wis), Burnett ty(Wis), Recreation homes, Lakeshore pro development.

The controversy surrounding the early dev ment of Voyager Village, a 6000 acre second development in eastern Burnett County, Wi sin, is described. The Voyager Village pro called for approximately 4000 lots of 20,000 s feet each. Approximately 50% of the total ac was to be maintained as open space or use community facilities including a clubhouse bles, and ski chalet. It was expected to att population of about 10,000-13,000 when developed, in contrast to the Burnett Co permanent population of about 10,000. Oppo arose from some permanent residents of the as well as second-home-owners already Their basic concerns were the increased t loss of natural resources, crowding, service lake pollution from septic tank seepage, sho erosion, road runoff and increased use of The conflict between these groups, exemplif its most concrete form by the Webb Township's subdivision ordinance intend limit large-scale development, was sustained a period of years. While a number of state ag were involved in specific aspects of the de ment question, the broader issue of how n resources may best be used was never addr at the state level. Ultimately, most aspe Voyager Village were developed, with modification. (Luedtke-Wisconsin).

SUMMARY OF THE REPORT OF THE DANIEL COMMITTEE OF INQUIRY INTO WATER CHARGES.
Water Services, Vol. 79, No. 955, p. 361-362, 1975.

Descriptors: *Water rates, *Pricing, *Water policy, Water demand, Water utilization, Legislation, Water allocation(Policy), Regulation, Domestic water, Industrial water, Sprinkler irrigation, Financing, Cost allocation, Europe.
Identifiers: England, Wales, Welsh National Water Development Authority.

The background, 1974-75 water charges, future pricing policy, relation to other water authorities, area, and accountability of the Welsh National Water Development Authority (WNWDA) are summarized. It is concluded that the Water Act of 1973 has produced an excessive difference in the average level of water charges between the WNWDA and other water authorities which should be reduced by legislation. Recommendations include giving a Welsh Assembly executive responsibility for water supplies in Wales and pricing transferred water on a commercial basis, or is the present organization is sustained the scope of commercial pricing should be extended or a levy-subsidy scheme should be developed to reduce charges to WNWDA consumers to within 10% of the national average. The necessity of these steps is based on the conclusion that providing water to consumers in rural areas such as Wales is inherently more expensive than supplying urban districts in England. ICELAND'S WINTER COD CATCH SHOWS SERIOUS DECLINE,
D. Glen.
Fishing News International, Vol. 14, No. 12, p. 17-18, 1975.

Descriptors: *Fish harvest, *Demersal fish, Protection, Marketing, Crustaceans, Foreign countries, Tariff, International waters, Export, Freezing.
Identifiers: *Iceland, *Codfish.

Icelandic demersal fish catches and codfish landings have recently been decreasing. Iceland has declared a 200-mile fishing limit, because they believe that overfishing of cod, especially immature fish, by foreign trawlers is causing the decline. By allowing fish to grow and accumulate more weight and spawn at least once, the annual yield should increase. More than 100 species of fish have been found near Iceland, which is located at the convergence of the warm Gulf Stream and cold, nutrient-bearing Arctic currents. About 15-20 species are commercially valuable. Cod, then saithe (coley), ocean perch (redfish), haddock, and catfish are especially important. Flatfish (plaice, Greenland halibut, lemon sole, witches, and megrins) are also caught. There is concern that foreign trawlers may be depleting plaice stocks, so protective measures are proposed. Markets for the various species vary. At present flatfish are frozen whole and not filleted, but Britain has increased tariffs on whole fish, so this may change. The nephrod (Norway lobster tails) market is very lucrative. Fishing for lobster is closely protected and a strict quota enforced. A 12% British import tariff on shrimp has slowed the shrimp fishery. A new profitable product is the scallop. (Buchanan-Davidson--Wisconsin).

SHRIMP SUPPLIES IN THE SOUTHEAST AND THEIR EFFECT ON PROCESSING FIRM SIZE,
Florida Univ., Gainesville. Dept. of Food and Resource Economics.
J. C. Cato.
In: Coastal Plains Center for Marine Development Services 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 37-39.

Descriptors: *Industries, *Fish handling facilities, *Southeast U.S., *Florida, Economic impact, Import, Industrial production, Fish harvest.
Identifiers: Shrimp harvest deficit.

The growing deficit in the domestic shrimp supply and its effect on the shrimp processing industry in the Southeast are discussed. Shrimp products accounted for $89 million, representing 61% of all seafood processed in the region and 76% of all shrimp processed in the U.S. in 1973. While the processing industry has been growing, shrimp landings in Florida have declined from about 50 million pounds in 1960 to almost one-half, due primarily to a change in landing patterns and structural changes within the industry. The declined shrimp supply promotes Mexican and Indian imports, which have increased substantially. The supply problem has affected the historical entry-exit patterns of firms in the industry; new entrants and existing processors must make a careful choice of product lines, plant locations, size of operations, and consider increased transportation costs. Entry of small firms into the industry will be enhanced if they have an isolated market and/or produce a specialty product. Large and small firms will be much more viable than medium size firms. The Florida shrimp processing industry will reach an equilibrium of 19 in 1985. The number of small firms will increase, medium size firms will decline, and the number of large firms will remain stable. (See also W76-09329) (Auen-Wisconsin)

6D. Water Demand

A NON-LINEAR PROGRAMMING MODEL FOR EVALUATING WATER SUPPLY POLICIES IN THE TEXAS COASTAL ZONE,
Texas Univ. at Austin.
R. A. Rios.
Available from University Microfilms, Inc., Ann Arbor, Mich., 48106. Order No. 76-8095. Ph.D. Thesis, 1975, 123 p.

Descriptors: *Water supply, *Water users, *Municipal water, *Industrial water, *Model studies, Water resources development, Water reuse, Water policy, Coasts, *Texas, *Water demand.
Identifiers: Non-linear programming models, Corpus Christi(Tex).

The water supply in Corpus Christi, Texas, could become a constraint on the area's development due to limits of available industrial and municipal supplies. A non-linear model was used for determining the quantity of fresh water needed for future demands and evaluating alternate methods to reduce demand on the primary source. In 1974 the use of the available water resources was less than optimal. Three policies for reducing water demand were studied. These increased fresh water and effluent disposal costs for various groups of users under specific conditions. Uniformly increasing the fresh water cost for all users produced maximum recycle and effluent reuse, resulting in zero discharge of waste water. The total system cost was increased most by this uniform increase. Increasing fresh water cost for industry only produced zero discharge for industrial waste water, but not zero discharge, since no economic incentive for reusing municipal waste water was provided. An effluent tax increasing disposal cost also produced zero discharge for industrial waste water, but reduced municipal demand less than the other policies did. About one-third reduction in total demand could be achieved. These policies would raise waste water treatment and fresh water supply costs considerably, but total costs would still be approximately 1 to 2% of the gross output of the industrial sector in the area. (Snyder-FIRL)

A PLAN FOR STUDY OF WATER AND ITS RELATION TO ECONOMIC DEVELOPMENT IN THE GREEN RIVER AND GREAT DIVIDE BASINS IN WYOMING,
Geological Survey, Cheyenne, Wyo.
H. W. Lowham, L. L. De Long, and K. D. Peter, et al.
Open-file report 76-349, May 1976. 92 p, 37 fig, 11 tab, 73 ref.

Descriptors: *Water resources development, *Water demand, *Water quality, *Hydrologic data, *Wyoming, Projections, Available water, Surface waters, Groundwater resources, Water yield, Chemical analysis, Data collections, Mining, Economic prediction.
Identifiers: *Great Divide Basins(Wyo), *Green River(Wyo).

Development of extensive coal, oil, gas, trona, and oil-shale resources as well as other developments in the Green River and Great Divide Basins in Wyoming will require a projected increase in water consumption of 490,000 acre-ft per year 2020. Developments of energy resources in o parts of Wyoming will also require large amou of water; transbasin diversion of Green R water to other areas could total an additio 270,000 acre-ft per year. In anticipation of thi creased demand, water planners and mana need much more information about avail ground and surface waters, present quality of waters, and hydrologic effects that would caused by development of energy resources. U.S. Geological Survey is conducting an exten hydrologic study of the basins. This report s marizes the study plan and discusses partic methods of approach that would be utilized in study. Regarding water quality, particular at tion is being given to trace metals, biolog characteristics, and trend analyses of sali Channel-geometry techniques, detailed statis analyses, and mathematical models are being plied to surface-water studies. An updated wel ventory, aquifer tests, and borehole and sur geophysical surveys are being used in gro water studies. (Woodard-USGS)

Descriptors: *Water resources, *Cities, *F planning(Projected), *Water supply, *T Water wells, Population, Projections, Reserv Water demand, Groundwater resources, W storage, Water distribution(Applied).
Identifiers: *Henderson(Texas).

A long-range water supply development pla Henderson, Texas, includes development o existing water well system to its ultimate cap and alternatives for future surface water sup based on population projections for future demands. Projections indicate that the ave daily demand in 1995 will be 2.82 mgd with a imum of 6.2 mgd; for 2025 it is projected tha demand will be 5.32 mgd with a maximum of mgd. The total water supply capacity availa approximately 7.3 mgd. Existing wells wi adequate beyond 1995 if developed to full cap and maintained in good operating condition. W should be pumped into ground storage tanks wells rather than directly into the distrib system to enable the well to produce its maxi rated capacity. Future wells should be drilled of the city, properly spaced, and piped to gr storage facilities. New water mains and st tanks should be installed as additional well developed. Negotiations with the Texas Uti Services, Inc., should be conducted to deter the feasibility of utilizing their proposed rese as a municipal water supply. Construction

PARTICIPATION IN WATER CES PLANNING: AN EVALUATION PROGRAMS OF 15 CORPS OF EN- DISTRICTS,
ames) Associates, Pacific Palisades,

n, Jr.

Submitted to the U.S. Army Engineer In stitute for Water Resources, Fort Belvoir, Virginia. IWR Contract Report 75-6, November 1975. 219 p, 2 append.

Descriptors: *Evaluation, *Planning, *Water resources development, *Project planning, *Decision making, Public rights, Institutions, Management, Social aspects, *Social participation.
Identifiers: *Public participation, *Army Corps of Engineer districts.

This report evaluates current (1973) public participation practices in U.S. Army Corps of Engineer offices and provides planners with specific experiential guidance on how to integrate increased participation into planning. Part one describes programs in 13 districts, none of which regularly or systemically plan for public participation. The purposes of participation, identification of publics, and various participation techniques are discussed in general terms. The programs of the Seattle District, the only field office which systematically tries to involve the public in all its studies, and the Rock Island District, which initiated additional techniques to supplement mandated public meetings, are discussed in some detail. Part 2 concerns organizing for effective participation. It is stressed that participation must be made an integral part of district policy in order for it to be effective. There must be a commitment to public involvement and an organizational structure which facilitates this. Adequate resources must be available. Part 3 details the planning process: preparing study plans, identifying problems and needs, forumulating alternatives, analyzing impacts, and evaluating impacts. District programs are analyzed in relation to these 5 study phases and recommendations for improvements are made in each section. Part 4 deals with other participation issues, including participation in post-authorization planning, and constraints which the Corps and the public place on public participation. ANNUAL REPORT FOR THE YEAR ENDING MARCH 31, 1975, SASKATCHEWAN DEPARTMENT OF THE ENVIRONMENT.
Saskatchewan Dept. of the Environment, Regina.
March 31, 1975. 51 p, 16 fig, 3 plates, 6 tab.

Descriptors: *Floods, *Water supply, *Water pollution, *Environment, *Groundwater, Research, Land use, Planning, River basins, Air pollution, Water quality, *Water rights, *Canada.
Identifiers: *Qu'Appelle River Basin(Sask), Saskatchewan River(Sask).

Objectives and activities of different agency branches are described. Hydrology branch, which carries out reservoir and river system operation planning and stream-flow forecasting and collects basic hydrometric, meteorological, snow survey, sedimentation and allied data, reported that floods from extremely heavy spring snow melt caused some 20,000 acres of flood plain agricultural lands in the Qu'Appelle River Basin to be under water all summer with Moose Jaw having major flooding. Floods also affected areas of the Souris River and Saskatchewan River Basins. The Water Rights branch grants licenses for use of surface and ground water resources, estimates ground water storage and investigates other aspects of water rights. At present less than 1% of total groundwater storage capacity is pumped every day, far less than seeps into the ground. Flows into the U.S. from Lodge Creek, Battle Creek, Frenchman River and the Souris River exceeded the 50% allotted by the International Joint Commission. A major undertaking was the beginning of implementation of the Qu'Appelle Basin Study Report. Initiation of flood protection plans involved meetings with town and village councils to consider proposals for a large reservoir and a diversion channel east of Moose Jaw. Environmental Protection Service contains branches of Air Pollution Control, Water Pollution Control including water quality monitoring, and Land Protection. Policy, Planning and Research Branch develops and coordinates environmental research programs. Systems and Computer Section and Administration Branch serve the other branches. (Smith-North Carolina)

THE VIRGINIA INSTITUTE OF MARINE SCIENCE, VIRGINIA'S MARINE SCIENCE, ENGINEERING, EDUCATION, AND ADVISORY SERVICES PROGRAM,
Virginia Inst. of Marine Science, Gloucester Point.
W. J. Hargis.
In: Coastal Plains Center for Marine Development Services 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 9-13. 2 fig.

Descriptors: *Research facilities, *Virginia, Resources development, Continental Shelf, Coasts, Continental Slope, Oceanography, Education.
Identifiers: Virginia Institute of Marine Science, *Coastal zone management, Marine resources.

The functions and scope of the Virginia Institute of Marine Science, created by Commonwealth legislative mandata, functions to maximize use of the marine resources and environments for the public welfare, to maintain their quality and to conserve resources for the future. In this context its principal tasks are to do research and engineering development on the marine resources and their uses; to provide advisory and technical services; and to provide education in all areas of marine resources and their uses; to provide education in all areas of marine science and conservation. The operational area includes all of the tidal waters of Virginia and the adjacent Atlantic Ocean. VIMS's products are knowledge, advice and other technical assistance to decision-makers, including the Commonwealth General Assembly, executive agencies, industry and the public. The Institute's current focus is on coastal zone management; Outer Continental Shelf oil and gas development; fishery management improvements; resource inventory preparation; environmental baseline and inventory preparation; wetlands preservation and management; environmental impact statements; ocean dumping and pollution; and advisory services and technical assistance programs to public and private managers and users. LEGAL ASPECTS OF PUBLIC ACCESS TO BEACHES,
Hartzog, Lader, and Richards, Hilton Head Island, S.C.
P. Lader.
In: Coastal Plains Center for Marine Development Services 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 41-53. 73 ref.

Descriptors: *Beaches, *Public access, *Legal aspects, *Seashores, Public rights, Recreation, Coastal Plains, Prescriptive rights, Easements, Condemnation, Contracts, Zoning, Regulation, Compensation, Littoral.
Identifiers: *Coastal zone management, Tidelands.

To the extent that the demand for additional public access to beaches in the Coastal Plains Region can be met by government acquisition and traditional exercise of the police power, no extraordinary remedies are needed. But since state and local treasuries often cannot meet the needs created by national recreational goals of states' coasts, the expansion of beach recreation opportunities will likely require the use of historic legal doctrines and innovative legal mechanisms, which must also withstand the challenges of the constitutional prescription against uncompensated takings and the traditional understandings of the police power. Thus combinations of acquisition, regulation, and common law evolution are required. The discussion examines the common law tradition as related to the Public Trust Doctrine; beach acquisition by conservation regulations and easements; the police power and the taking issue; land use controls; the compensation mechanisms; and the role of the federal and state regulatory agencies. Legislative enactments by Texas, California, Washington, New Hampshire, Florida, Connecticut, Delaware, Hawaii, Louisiana, New Jersey, North Carolina and Rhode Island directed toward beach acquisition illustrate various approaches. (See also W76-09329) (Auen-Wisconsin)
W76-13104

BACK BAY NATIONAL WILDLIFE REFUGE. SOME PARALLELS IN IMPLEMENTING THE COASTAL ZONE MANAGEMENT ACT,
Back Bay National Wildlife Refuge, Virginia Beach, Va.
D. F. Holland.
In: Coastal Plains Center for Marine Development Service 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 55-60.

Descriptors: *Public access, *Conservation, *Beaches, *Seashores, Access routes, Attitudes, Recreation, Boundary disputes, National Wildlife Refuges, *Virginia, North Carolina, Legal aspects.
Identifiers: *Coastal zone management, Back Bay Wildlife Refuge(Va).

The public opposition, legal contentions, and court decisions generated by the establishment of the Back Bay National Wildlife Refuge in Virginia, are cited as parallel impediments to be anticipated in coastal beach acquisition, planning, and management under P.L. 92-583, specifically as related to (1) inventory and designation of areas of concern, (2) priority of uses, (3) determination of permissible uses, and (4) the conrol of those uses. Up to the early 1950s no public access was available to the Refuge; but shortly after paving one road, summer homes began to multiply and real estate developments began to proliferate. By 1969 beach traffic and its attendant problems of litter, drunkenness, vandalism, car abandonment, accidents, theft and assaults were totally beyond the abilities of the Refuge management to control. Consequently, the Fish and Wildlife Service of the Department of the Interior imposed restrictions on vehicular access. A civil action was instituted by the local opposition to the restriction in the Federal District Court, with a hearing set for April 1973. The result was a temporary injunction on the restriction based on the plaintiffs' contentions of invalidity. That contention was set aside in 1975 in a strong ruling for the Department of the Interior. The experience showed that public use patterns are directly related to vehicular access. FREEING THE BEACHES: IS IT POSSIBLE,
Bureau of Outdoor Recreation, Atlanta, Ga. Southeast Regional Office.
R. M. Baker.
In: Coastal Plains Center for Marine Development Service 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 61-64.

Descriptors: *Beaches, *Public rights, *Trespass, *Legal aspects, Public lands, Public access, Connecticut, Recreation, Seashores, High water mark, Right of Way, Easements, Adverse possession, Repulsion(Legal aspects), Zoning, Compensation.
Identifiers: *Coastal zone management, Public trust doctrine, Customary rights.

How rights to beaches already in public use can be retained, public access, and rights to new land gained (in addition to the Bureau of Reclamation's grant role) are suggested. South Carolina, Georgia, and Florida have applied the public trust doctrine to beach acquisition. A New Jersey decision ruled against excessive use charges on the interpretation that beaches and open waters must be open to all on an equal basis. Another concept that can be employed is 'Implied Dedication', which governs donations of land for public use; or else 'Adverse Use' may provide the key to beach acquisition. Oregon and California use the 'Customary Rights' device to insure the public's right to beaches by negating the private owner's right to exclude the public. Another strategem is creation of a public easement under 'Prescriptive Rights'; or the 'Subdivision Exaction'--a requirement that forces a developer to dedicate a public easement. 'Exclusive Use Zoning', which constructs a zoning district permitting only recreational and ancillary open space uses, is another device that can be applied. Donations of land can be encouraged by demonstrating potential tax advantages. Another option is 'Compensable Regulations', where the State regulates land then compensates landowners for losses. Court rulings may be favorable in all these cases under the broad umbrella of public safety, and the preservation or conservation of a unique natural area. (See also W76-09329) (Auen-Wisconsin)
W76-13106

THE ROLE OF INTERSTATE COMPACTS IN FISHERIES MANAGEMENT,
Atlantic States Marine Fisheries Commission, Washington, D.C.
I. M. Alperin.
In: Coastal Plains Center for Marine Development Service 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 65-68.

Descriptors: *Marine fisheries, *Interstate compacts, *Institutions, *Interstate commissions, Fish management, Shrimp, Planning, Federal government, State governments, Jurisdiction.
Identifiers: *Coastal fisheries management.

The Atlantic States Marine Fisheries Commission shares with the Coastal Plains Regional Commission the five states, Virginia to Florida. The purpose of the ASMFC, as well as of the Gulf States and Pacific Marine Fisheries Commissions, is to provide for better utilization of fisheries along the seaboards. Recently these interstate compact commissions have come forth in support of a new initiative --the State-Federal Fisheries Management Program--in which the commissions play a supportive role in communications, planning, coordination and administration of the SFFMP, resulting in a cooperative effort involving the commissions as regulatory (management) institutions with state and federal administrators and scientists providing financial and technical input while the states practice reciprocal enforcement. This institutional arrangement is viewed as a practical solution to regional fisheries management. However, the viability of the commissions is threatened by House and Senate bills currently under consideration, which propose establishment of regional management councils and which would usurp the states rights and needs. The states oppose the ultimate powers vested in the Secretary of Commerce, the large council structure, and feel that federal licensing will deprive them of funds upon which they depend to support their own fisheries research and management programs. It is proposed that the interstate commissions should retain their identities as State-funded and St governed entities. (See also W76-09329) (Au Wisconsin)

d, M. J. Youngbluth, M. E. Nutt, P.
, and M. J. Canoy.
from the National Technical Informace, Springfield, VA 22161, as PRNC 181, aper copy, $3.00 in microfiche. Report , April 1975, 227 p, 89 ref, 32 fig, 22 tab, AT(40-1)-1833.

Descriptors: *Data collections, *Sites, Powerplants, Geologic investigations, On-site investigations, Ecology, *Puerto Rico, Physical properties, Chemical properties, Bays, Zooplankton, Invertebrates, Fish.
Identifiers: *Tortuguero Bay(PR).

Tortuguero Bay is one of seven coastal sites on which physical, chemical, and geological parameters have been studied. Ecological parameters of zooplankton, benthic invertebrates and fish communities, and plant associations were also studied. The purpose of the studies was to gather data which would be useful in the assessment of the desirability and practicability of locating power generating plants on one or more of the sites. SITE AND DESIGN TEMPERATURE RELATED ECONOMICS OF NUCLEAR POWER PLANTS WITH EVAPORATIVE AND NON-EVAPORATIVE COOLING TOWER SYSTEMS,
Gilbert Associates, Inc. Reading, Pa.
J. F. Sebald.
Report C00-2392-1, January 1976, 419 p, 37 fig, 137 tab, 4 ref. E(11-1) 2392.

Descriptors: *Cost analysis, *Design, *Temperature, *Sites, Economics, Nuclear powerplants, *Cooling towers, *Lake Michigan, Great Lakes, Evaporators.

The study was planned to include a wide range of plant design temperatures, develop cost elements suitable for the adjustment of differences in site, time, and location, and to develop cost sensitivity criteria such that the mass of cost data produced may be extended to include plants sited most anywhere in the United States. Two sites were selected for the study, each having characteristics which require special consideration. It was concluded that plants with evaporative cooling tower systems are economically preferable to equivalent plants using non-evaporative cooling tower systems. The cost data developed for plants with evaporative cooling systems showed that, for equivalent plants, the cost differences between natural draft and mechanical draft cooling tower systems were small, on the order of 0.5 to 0.8%. HABITAT EVALUATION PROCEDURES.
Fish and Wildlife Service, Washington, D.C., Div. of Ecological Services.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 254, $4.00 in paper copy, $3.00 in microfiche. July 1, 1976, 30 p.

Descriptors: *Water resources development, *On-site investigations, *Carrying capacity, *Habitats, *Analytical techniques, *Evaluation, Ecology, Economics, Projects, Costs, Benefits, *Project planning, Annual equivalent costs, Annual equivalent benefits, *Wildlife, Hunting, *Fishing, Edge effect, *Aquatic habitats, *Terrestrial habitats, Wetlands, U.S. Water Resources Council, Wildlife management.
Identifiers: Principles and Standards for Planning, National Environmental Policy Act(NEPA), Fish and Wildlife Coordination Act.

Habitat evaluation procedures were developed as a uniform, nationwide method for determining impacts on fish and wildlife and their habitat, arising from water and related land resource development projects. The procedures are divided into two main parts, one which measures the ability of the habitat to sustain fish and wildlife, and the other to measure the level of hunting and fishing which the habitat can sustain and still replenish itself from year to year. For each procedure, the quality of the habitat is measured either in ecological or economic terms, then the losses or gains estimated to be sustained with the construction of a water or related land resource development project are calculated and annualized over the life of the project. Provision is made to compare several alternative plans for the area in term of habitat units for the ecological section, and in dollars for the economic section. An additional feature of the ecological section of the procedure involves estimating the increase in carrying capacity which can be attained with wildlife management. This value is then used to calculate the amount of habitat needed to compensate for wildlife losses attributable to the installation of the project. (Winters-FWS)

SOME ECOLOGICAL ASPECTS OF THE CABORA BASSA DAM,
Rhodes Univ., Grahamstown (South Africa). Inst for Freshwater Studies.
B. R. Davies, A. Hall, and P. B. N. Jackson.
Biological Conservation, Vol. 8, No. 3, p 189-201, 1975. 1 fig, 25 ref.

Descriptors: *Environmental effects, *Dams, *Africa, *Reservoirs, Electric power production, Productivity, Sediment transport, Deltas, Tropic, Aquatic weed control, Social aspects, Biocontrol, Insects, Floating plants, Vectors(Biological), Fish, Fisheries, Economic impact, Water pollution control, Recreation, Human population, Conservation, Wildlife management, Industries.
Identifiers: *Cabora Bassa Dam(Mozambique), Zambezi River(Mozambique), Paulina acuminata, Neochetina eichhorniae.

The lake resulting from the Cabora Bassa Dam on the Middle Zambezi in Mozambique, South Africa, is expected to eventually produce 3870 mw of electricity by September 1975. The potential of the region is enormous. At first the lake will have a large nutrient increase; initially this may be slowed by production of reducing substances such as hydrogen sulfide. The lake will tend towards oligotrophy. Invasion by aquatic macrophytes will be a problem. Mechanical and herbicidal removal is not feasible, but biological control is being considered. As nutrient levels stabilize, weed infestations should decrease. Floating weeds conserve major nutrients and provide shelter for fish fry. Draw-down for weed control would reduce marginal hydrophyte development. Fish will initially be species present in the river. Floating aquatic macrophytes and uncleared bush may make fishing difficult at first but a pelagic fishery shows promise. Possible ecological effects of the lake on wildlife in the area and downstream are discussed. Public health problems may arise; and the effects of resettlement of a 25,000 population are evaluated pro and con. Conservation measures are proposed with regard to recreational facilities, game reserves, and heavy industry. (Buchanan-Davidson--Wisconsin)
W76-12945

THE SOCIAL AND ECONOMIC IMPORTANCE OF THE CARONI SWAMP IN TRINIDAD AND TABAGO,
Michigan Univ., Ann Arbor. Dept. of Natural Resources.
B. S. Ramdial.
Available from the National Technical Information Service, Springfield, VA 22161 as COM 75-10846, $9.00 in paper copy, $3.00 in microfiche. PhD theiss, 1975. 266 p. 24 fig., 9 tab., 73 ref., 9 append.

Descriptors: *Natural resources, *Conservation, *Resource allocation, Economic rent, Land use, Social values, Recreation, Tourism, Land use, Na-

tional parks, *Mangrove swamps, Estuaries, Fisheries, Statistical methods, Aesthetics, Employment, Benefits, Comprehensive planning, Management, Bird types, *Swamps.
Identifiers: *Caroni Swamp(Trinidad/Tobago).

The threat of development and land use patterns to Trinidad and Togago's outstanding Caroni Swamp engendered this social and economic study to determine its benefits. Non-priced recreational benefits, estimated by the travel-cost method, indicate that the Swamp resources are valued at $1,038,500, with the addition of employment for 240 full-time and 105 part-time persons. The fin and shellfish harvest is valued at $981,450 and based on a total annual return of $2,020,020 calculates the present worth at $4,000/acre. The opportunity cost is estimated at $1,398,330 and the social cost at $2,625,000, excluding multiplier effects and demand projections. The weakness of using the market system to guide public policy is discussed. Alternative measures for conflict situations and potential areas for development are described. In the absence of a competent central authority with clear, social, economic, and legal guidelines within which to operate, the intrinsic values of the Swamp are progressively deteriorating, conflict situations are growing and unfettered developmental pressures are mounting. It is recommended that this estuarine Swamp be declared a national park to preserve its employment opportunities, the large quantities of protein produced, the fish and wildlife supported, the educational opportunities available, the aesthetics, the coastal storm buffer, and its function in the abatement of inland flood waters. ENERGY DEVELOPMENT: THE ENVIRONMENTAL TRADEOFFS. VOLUME 3: RELATIVE ENVIRONMENTAL RANKING OF PROPOSED OFFSHORE CONTINENTAL SHELF AREAS ON THE BASIS OF IMPACTS OF OIL SPILLS,
Stanford Research Inst., Menlo Park, Calif.
P. J. Kinney, P. D. Carpenter, M. D. Levine, and S. H. Traver.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 002, $4.50 in paper copy, $3.00 in microfiche. Prepared for the Office of Planning and Evaluation, U.S. Environmental Protection Agency, Washington, D.C., September 1975. 61 p, 14 fig, 10 tab, 40 ref. 68-01-2469.

Descriptors: Aquatic habitats, Ecosystems, *Trophic level, *Aquatic environment, *Oil spills, *Oil pollution, *Oil wells, Phytoplankton, Zooplankton, Fish, *Marine animals, Birds, *Atlantic Ocean, *Continental Shelf, *Benthos, *Biota, Alaska.
Identifiers: Benthic biotic, Shore-related biota, North Atlantic Ocean, *South Atlantic Ocean, *Mid-Atlantic Ocean, *Santa Barbara Channel, *South of Channel Islands, *Gulf of Alaska, *Bristol Bay(AK), *Beaufort Sea(AK), *Cook Inlet(AK), *Kotzebue Sound(AK).

Ten offshore regions, North Atlantic, Mid-Atlantic, South Atlantic, Southern California including Santa Barbara Channel and South of Channel Islands, the Gulf of Alaska, Bristol Bay, Beaufort Sea, Cook Inlet, and Kotzebue Sound were studied to determine the risks associated with oil drilling in the offshore continental shelf (OCS). Only the impact of oil spills were studied, and did not include impacts of man's activities in wilderness areas or the impact of changes, i.e., absorption of the sun's radiant energy due to oil on pack ice. The offshore regions were factored into ecological components based upon trophic levels and habitats. The components were phytoplankton, zooplankton, benthic biotic, shore-related biota, fish, marine mammals and birds. Biological and physical data were used to measure relative sensitivity of each ecological component to damage by oil; relative biological abundance; relative probabilities of major portions of the ecological component coming into contact with oil from a spill; and relative probabilities of a spill occurring. Each factor was evaluated on a 1 to 7 scale of increasing effect. Conclusions were that the least affected ecological areas would be the North Atlantic, Mid-Atlantic and Kotzebue Sound (AK); intermediate damage would occur in the South Atlantic, Beaufort Sea (AK), South of the Channel Islands and the Santa Barbara Channel; heavy damage is likely in Bristol Bay (AK), Cook Inlet (AK) and the Gulf of Alaska. (Gentry-NC)

A PROPOSED METHODOLOGY FOR ASSESSING ALTERNATIVE TECHNOLOGIES,
Cornell Univ., Ithaca, N. Y. Program on Science, Technology and Society.
P. L. Bereano, J. Callen, W. B. Kellner, G. R. Olson, and B. H. Wengenroth.
Technology Assessment, Vol. 1, No. 3, p. 179-190. 6 fig, 20 ref.

Descriptors: *Methodology, *Decision-making, *Planning, *Technology, *Environmental effect, Environmental control, Probability, Alternate planning, *Evaluation.
Identifiers: Effects chain, Effects matrix, *Alaska pipeline.

A matrix methodology for decision-making which could be used to assess technological developments is proposed and applied to the case of the Alaska pipeline. The proposed methodology draws on past work by J. C. Sorenson, Luna Leopold, I. D. J. Bross and two groups at Cornell University, the first 2 theories are analytical matrix methodologies and the third is an individual planning process. The matrices related actions which cause environmental impact with existing conditions and characteristics of the environment. Bross developed a prediction system wherein probabilities are assigned to various outcomes producing a numerical value which can be used to make decisions, and also involves a value system in which a value indicating the desirability of an outcome is assigned to each outcome. This report utilizes a matrix scheme which arrays the action alternatives on one axis and variables or parameters on the other axis. To identify appropriate parameters, and effects chain was developed as a visual technique to generate and display all parameters or effects associated with actions taken. The effects chain suggests causal relationships with parameters being the endpoints of the chain. An effects matrix lists intersections between parameters and techniques, thus serving as a helpful guide in the decision-making process. The next stage in developing a rational decision-making methodology would be to assign probabilities, utilities and importance to the outcomes described in the effects matrix. Public participation in decision-making may be enhanced by separating technical analysis from value weights and by forcing the disaggregation of complex systems. (Gentry-North Carolina)

ed data, Spectral density, Variance-
astic models.

ic, computer-oriented procedure was
o avoid the problems of selecting the
probability model for a particular cli-
environment and of using it for opera-
ses. The procedure avoided subjectivi-
ty in the selection of the model and eased the labor in the successful selection and application of the stochastic model underlying the particular hydrological phenomenon. The methodology for the statistical analysis of series of events by Cox and Lewis (1966) was extended and applied to hydrology for the analysis of daily rainfall sequences. The hydrological point process had time trends and cyclicity. A procedure for the detection and calibration of these time trends and cyclicities was developed on the basis of which a homogenization program was produced. Statistical tests could be performed on the homogenized data. A method of statistical analysis utilizing the rate of occurrence function, the spectrum of counts, the variance-time of counts, the spectral density, the autocorrelation function, and the log-survior function of the interarrival times was applied to the homogenized data to select a model that suited the behavior of these functions and passed the statistical tests. Several of these functions were tabulated for some point stochastic models. (Roberts-ISWS)

Available from the National Technical Information Service, Springfield, VA 22161 as ANL/WR-76-1, $9.00 in paper copy, $3.00 in microfiche. Report ANL/WR-76-1, March 1976, 252 p, 42 fig, 10 tab, 23 ref, 3 append. W-31-109-Eng-38.

Descriptors: *Data collections, *Currents(Water), On-site investigations, Winds, Forecasting, Great Lakes, *Wisconsin, *Lake Michigan, *Lake shores.

The goals of this research effort were to obtain an expanded data base for nearshore currents and winds in the vicinity of Point Beach, to determine the mechanisms governing the nearshore currents, to develop a predictive capability for determining the nearshore currents and to improve understanding of the processes of dispersion in the nearshore regime. Currents were monitored at stations 0.4, 1.1, and 3.8 km from shore. Graphs for the current and wind observation are presented which depict (1) U, V flow components versus time, (2) specific kinetic energy versus time, (3) flow speeds and directions versus time, (4) composite velocity histograms and associated U, V-component histograms, and (5) progressive vector diagrams. Optimal linear filtering techniques were used in prediction of nearshore currents. (Chilton-ORNL)

Journal of Hydraulic Research, Vol. 14, No. 1, p 37-44, 1976. 6 fig, 1 tab, 6 ref.

Descriptors: *Flow measurement, *Flow rates, *Flow, *Instrumentation, Conductivity, Equipment, Laboratory tests, Velocity, Salinity, Turbulence, Sediment control.
Identifiers: *Conductivity flow meter, Salt velocity method, Time of travel, Flow meters, Mean velocity.

The Conductivity Flow Meter (CFM) was shown to be a useful modification to existing salt velocity methods of flow measurement. This preliminary work clearly demonstrated the practicability of the CFM. Future work is aimed toward determining the range of application of the method and developing a set of operator guidelines for establishing geometric requirements of locating equipment in different channels. The figures demonstrated that the CFM is an acceptable alternative to the conventional current meter for measuring flow velocities. (Morris-ISWS)

THE COASTAL PLAINS REGIONAL COMMISSION--U.S. GEOLOGICAL SURVEY. AEROMAGNETIC-AERORADIOACTIVITY SURVEY,
Geological Survey, Reston, Va.
I. Zietz.
In: Coastal Plains Center for Marine Development Services 'Report of the Conference on Marine Resources of the Coastal Plains States', December 11-12, 1975, Savannah, Ga., p 5-8.

Descriptors: *Coastal plains, *Surveys, *Oil, *Metals, North Carolina, South Carolina, Georgia, Methodology, Geologic formations, *Radioactivity techniques, *Electromagnetic waves, *Remote sensing.
Identifiers: *Aeromagnetic survey, *Aeroradioactivity survey, Ores, Minerals.

The Coastal Plains Regional Commission expended $100,000 for surveys of North and South Carolina and Georgia to determine the potential of ore and oil deposits in this region. An aircraft, equipped with a magnetometer, flew continuous lines at a 500-ft altitude with a flight separation of one mile. A radioactivity survey was conducted jointly with the gamma measurements. Contours were compiled from the data and then digitized and transferred to magnetic tape for ready access. The radioactivity survey portion of the effort showed that there are three major monazite belts, paralleling the Piedmont and extending from Alabama to Virginia. Monazite is associated with titanium. The largest radioactivity anomalies were found along the Altamaha River. Chemical measurements of grab samples and two drillholes were used to determine the thickness of the deposit. The initial results of the investigations suggest that one deposit may be worth as much as $1.5 billion. The total value of the combined six deposits in that vicinity are estimated to be as much as $6 billion. The survey methods, as related to geology, are explained. G. H. Miller, and D. W. Berg.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-022 336, $4.00 in paper copy, $3.00 in microfiche. Miscellaneous Report No. 76-2, January 1976. 41 p, 12 fig, 5 tab, 14 ref.

Descriptors: *Remote sensing, *Coasts, *Estuaries, *North Carolina, *Atlantic Ocean, Rivers, Inlets(Waterways), Shallow water, Satellites(Artificial), Sand bars, Beaches, Suspended solids, Sediments, Coastal marshes, Oceans.
Identifiers: *ERTS.

Unenhanced imagery recorded by the multispectral scanner (MSS) of the NASA Earth Resources Technology Satellite (ERTS-1) was analyzed to determine how satellite imagery may be applied to specific coastal engineering problems. The study area was a segment of the North Carolina coast comprising Wrightsville Beach, Masonboro Inlet, Masonboro Beach, Carolina Beach Inlet, and Carolina Beach, which are areas of ongoing research by CERC. Analysis was supplemented by underflight imagery supplied by NASA and ground-truth data. Several significant coastal features were visible in the ERTS-1 imagery. Among those were plumes of suspended sediment emerging from inlets, changes in water coloration possibly due to effects of temperature change, inlet bars, and cape bars. In addition, morphological changes in selected coastal land features were determined by comparing ERTS-1 films obtained about 1 year apart. Limited water depth penetration was afforded by examining the lower MSS spectral bands. It was learned that maximum penetration can be expected to measure in tens of feet, depending on the physical characteristics of ocean water. Although inadequate for deeper penetration, this capability is adequate for exposure of backshore and nearshore underwater features. Image resolution capability is sufficient for observation of gross coastal features and processes but may not be adequate for viewing smaller features such as wave patter morphological features on beaches, and many gineering structures. INTERDISCIPLINARY APPLICATIONS INTERPRETATION OF EREP DATA WI THE SUSQUEHANNA RIVER BASIN,
Pennsylvania State Univ., University Park. C for Remote Sensing of Earth Resources.
G. J. McMurtry, and G. W. Petersen.
Available from the National Technical Inf tion Service, Springfield, VA 22161 as N75-2 $3.50 in paper copy, $3.00 in microfiche. Qua Progress Report, December 1974-February 15 p. NASA NAS9-13406.

Descriptors: *Remote sensing, *Data proce Resources, *Pennsylvania, *Resources dev

, Geology, Mining, Lead, Zinc, Frac- (Geologic), Groundwater, Photography, puter programs, Acid mine water, Projects. ifiers: *ERTS, *SKYLAB, Lineaments, interpretation, *Susquehanna River basin.

nt research activities of the SKYLAB EREP tigation were described. The following activi- ere mentioned: It has become evident that nents seen on SKYLAB and ERTS images t equally well defined, and that the clarity of tion of a particular lineament is recorded what differently by different interpreters. In ort to determine the extent of these varia- a semiquantitative classification scheme has devised. Lineament detections on SKYLAB RTS scenes are also being compared, with jective of determining if the same features en on both sets of data and to what extent ecision of determination differs for the two ets. Research has been continuing in the ication of ground evidence for lineaments eir usefulness in prospecting for lead-zinc ts. In the study of the applications of linea- to groundwater and geologic engineering ms, an additional area is being considered alysis. Thermal anomalies from SKYLAB RTS scenes are being studied using both interpretative and digital processing ques. The SKYLAB data quality com- n study is progressing rapidly. The SUB- and TPINFO programs have been revised cess tapes in the SKYLAB S192 line- tened and conical formats. Processing has on the newly received SKYLAB data tapes ee Pennsylvania areas. The study of acid drainage effects in Western Pennsylvania continued, using SKYLAB digital data. SWS)

D-WATER BASIC DATA FOR DUNN , NORTH DAKOTA.
al Survey, Bismarck, N. Dak.
using.

North Dakota County Ground-Water Studies 25--Part II, and North Dakota Geological Survey Bulletin 68--Part II, Bismarck, N. D. 1976. 501 p, 3 fig, 1 plate, 10 tab, 20 ref, 2 append.

Descriptors: *Groundwater, *Basic data collections, *North Dakota, *Water quality, *Well data, Aquifer characteristics, Geology, Observation wells, Test wells, Water levels, Drillers logs, Springs, Groundwater resources, Chemical analysis, Water chemistry.

The ground-water investigation in Dunn County, N.D., was made cooperatively by the U.S. Geological Survey, North Dakota State Water Commission, North Dakota Geological Survey, and the Dunn County Water Management District. The results of the investigation will be published in three separate parts. Part (1) is an interpretive report describing the geology of the study area; part (2) is a compilation of the ground-water basic data; and part (3) is an interpretive report describing the ground water resources. Part (2) (this report) contains basic data for 1,216 wells and test holes and 134 springs. It includes 632 logs of test holes and wells, 408 chemical analyses of water samples, and water-level measurements in 140 observation wells. The geologic formations penetrated by drilling are Upper Cretaceous, Tertiary, and Quaternary in age. (Woodard-USGS)
W76-12786

MAP SHOWING POTENTIAL SOURCES OF GRAVEL AND CRUSHED-ROCK AGGREGATE IN THE COLORADO SPRINGS-CASTLE ROCK AREA, FRONT RANGE URBAN CORRIDOR, COLORADO,
Geological Survey, Denver, Colo.
D. E. Trimble, and H. R. Fitch.
For sale by USGS Reston, Va., 22092, price $1.75.
Miscellaneous Investigations Series Map I-857-A, 1974. 1 sheet, 1 map, 1 tab, 9 ref.

Descriptors: *Fluvial sediments, *Geologic mapping, *Gravels, *Rocks, *Quarries, Mining, *Colorado, Rock mechanics, Particle size, Aggregates, Flood plains, Glaciation.
Identifiers: *Colorado Springs-Castle Rock area(Colo).

High-quality gravel in the Front Range Urban Corridor is restricted largely to areas beneath flood plains of major streams and to low terraces along these streams. Rock suitable for processing into crushed-rock aggregate is plentiful in the older rocks of the mountains, in certain volcanic rocks of the foothills and plains, and in certain limestones, mainly in the Colorado Springs area. For many years, crushed limestone has been the chief source of concrete aggregate in the Colorado Springs area. Potential sources of gravel or of aggregate have been grouped into eight map units-three of gravel and five of crushed-rock aggregate. A potential source of gravel, as here defined and mapped contains 20 percent or more of granule- and pebblesize stones (smaller than 2.5 in. or 6.4 cm but retained on a No. 10 U.S. Standard sieve). The minimum gravel content was placed arbitrarily at 20 percent of the deposit because this was estimated to be the most likely economic limit under the most adverse foreseeable conditions. The map units are based on differences in physical characteristics, which, in turn, determine relative quality for different uses. (Woodard-USGS)
W76-12787

LAND-USE CLASSIFICATION MAP OF THE COLORADO SPRINGS--CASTLE ROCK AREA, FRONT RANGE URBAN CORRIDOR, COLORADO,
Geological Survey, Denver, Colo.
L. B, Driscoll.
For sale USGS, Reston, Va., 22092, price $1.75.
Miscellaneous Investigations Series Map I-857-B, 1975. 1 sheet, 1 map, 2 ref.

Descriptors: *Land use, *Land classification, *Maps, *Urbanization, *Surface water, Land resources, Land management, Lakes, Reservoirs, *Colorado.
Identifiers: *Front Range Urban Corridor(Colo), Colorado Springs-Castle Rock area(Colo).

The Front Range Urban Corridor of Colorado, from Fort Collins on the north through Fountain on the south, is an area of rapid population growth and expanding land development. This map provides for the Colorado Springs-Castle Rock area the first step toward compatible land uses in the future--a comprehensive picture of the distribution of different land classes and an implication about the proportions of various uses. If used with maps showing resources, soil types, geology, water availabilty, topography, demography, and other attributes, this land-classification map helps to set limitations on use of the land. Once the limitations are known, zoning can help assure land uses that are compatible with the natural environment--for example, the zoning of flood plains for greenbelt or recreational use. (Woodard-USGS)
W76-12788

MAP SHOWING POTENTIAL SOURCES OF GRAVEL AND CRUSHED-ROCK AGGREGATE IN THE BOULDER-FORT COLLINS-GREELEY AREA, FRONT RANGE URBAN CORRIDOR, COLORADO,
Geological Survey, Denver, Colo.
R. B. Colton, and H. R. Fitch.
For sale by USGS, Reston Va., 22092, price $1.75.
Miscellaneous Investigations Series Map I-855-D, 1974. 1 sheet, 1 map, 1 tab, 39 ref.

Descriptors: *Fluvial sediments, *Geologic mapping, *Gravels, *Rocks, *Quarries, Mining, *Colorado, Rock mechanics, Particle size, Aggregates, Flood plains, Glaciation.
Identifiers: *Boulder-Fort Collins-Greeley area(Colo).

Deposits of high-quality gravel in the Boulder-Fort Collins-Greeley, Colo., area mostly under flood plains and terraces of major streams. Gravel and rock resources have been grouped into five map units; two are sources of gravel and three are sources of rock suitable for crushing. The map units are based not on quality judgments but on differences in physical characteristics which do determine quality which, in turn, determines suitability for different uses. Gravel deposits, as here defined and mapped, are inferred to contain at least 20-percent granule-and pebble-size stones: smaller than 2.5 inches (6.5 cm) but retained on a No. 10 (2 mm) U.S. Standard sieve. The minimum figure of 20 percent is estimated to be the lower limit at which gravel can be economically extracted from a deposit. Lower quality deposits have been worked in areas where haulage distances are short and a market for sand exists. (Woodard-USGS)
W76-12789

LAND-USE CLASSIFICATION MAP OF THE BOULDER-FORT COLLINS-GREELEY AREA, FRONT RANGE URBAN CORRIDOR, COLORADO,
Geological Survey, Denver, Colo.
L. B. Driscoll.
For sale USGS, Reston, Va., 22092, price $1.75.
Miscellaneous Investigations Series Map I-855-B, 1974. 1 sheet, 1 map, 1 ref.

Descriptors: *Land use, *Land classification, *Maps, *Urbanization, *Available water, Land resources, Watersheds(Basins), Surface waters, Land management, *Colorado.
Identifiers: *Front Range Urban Corridor(Colo), Boulder-Fort Collins-Greeley area(Colo).

The Front Range Urban Corridor of Colorado is undergoing rapid urbanization and sprawl. Land-use mapping is the first type of information needed

to provide a comprehensive picture of the distribution of the uses of land and an implication about the balance of the uses. Combined with maps of resources, soil types, water availability, topography, demography, etc., the limitations of the land can be established. At this stage land-use zoning can create the kind of end product desired. This map, then, provides for the Boulder-Fort Collins-Greeley area the first very crucial step in moving toward the prevention of incompatible land uses in the future. The Front Range Urban Corridor extends from Fort Collins on the north to Fountain on the south, and from the foothills on the west to Greeley on the east. (Woodard-USGS)
W76-12790

MAP OF ROCK TYPES IN BEDROCK OF ALLEGHENY COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
W. R. Kohl, and R. P. Briggs.
Available from Branch of Distribution, USGS 1200 S. Eads St. Arlington, VA 22202, $1.50. Miscellaneous Field Studies Map MF-685 A, 1975. 2 sheets, 2 maps, 2 fig, 2 tab, 36 ref.

Descriptors: Planning, Water resources development, *Land development, *Mineral industry, *Maps, *Pennsylvania, Geology, Rock properties, Bedrock.
Identifiers: *Allegheny County(Pa).

This map (Allegheny County, Pa.) is a tool useful in planning where a knowledge of characteristics of material to be moved, built upon, or otherwise utilized is necessary to adequately develop land, mineral, and water resources. Possible fields of application include land-use control, road construction, urban and industrial development water supply, and the search for nonmetallic mineral resources. On the map (scale 1:50,000 or 1 inch equals just over 4,000 feet), the types of rock likely to be found at or near the surface throughout the county are indicated by letter symbols keyed to the map explanation and two accompanying tables. Table 1 estimates the general engineering characteristics of the rock units, and table 2 describes the most common rock types in greater detail. Geological terms that may be unfamiliar are explained in the glossary. (Woodard-USGS)
W76-12791

ANNUAL SUMMARY OF GROUND-WATER CONDITIONS IN ARIZONA, SPRING 1974 TO SPRING 1975.
Geological Survey, Tucson, Ariz.
H. M. Babcock.
Water-Resources Investigations 76-59 (open-file report), May 1976. 2 sheets, 1 map.

Descriptors: *Groundwater resources, *Water fluctuations, *Pumping, *Irrigation, *Arizona, *Maps, Aquifers, Water wells, Water yield, Projections, Data collections, Water utilization, Water levels.

The withdrawal of ground water was slightly more than 5.7 million acre-feet in Arizona in 1974--the largest amount pumped in any year since the beginning of record. About 4.9 million acre-feet of ground water was used for the irrigation of crops in 1974. The Salt River Valley and the lower Santa Cruz basin are the largest agricultural areas in the State. For 1970-74, ground-water withdrawal in the two areas was about 8.3 and 4.6 million acre-feet, respectively, and, in general, water levels are declining. Other areas in which ground-water withdrawals have caused large water-level declines are the Willcox, San Simon, upper Santa Cruz, Avra Valley, Gila Bend, Harquahala Plains, and McMullen Valley areas. Two small scale maps of Arizona show (1) pumpage of ground water by areas and (2) the status of the ground-water inventory in the State. The map of the State at a scale of 1:500,000 shows potential well production, depth to water selected wells in spring 1975, and change in water level in selected wells from 1970 to 1975. The brief text that accompanies the maps summarizes the current ground-water conditions in the State. (Woodard-USGS)
W76-12792

HYDROLOGIC UNIT MAP--1974, STATE OF MONTANA.
Geological Survey, Reston, Va.
For sale by USGS, Reston, Va, 22092, $3.00. Hydrologic Unit Map, 1976. 2 sheets, 2 maps.

Descriptors: *Maps, *Hydrology, *Montana, Water resources, Data collections, Planning, Hydrologic systems, Regions, Land resources.
Identifiers: *Hydrologic unit maps(Mont), Hydrologic boundaries, Subregions, Accounting units, Cataloging units.

This map and accompanying table show Hydrologic Units in Montana that are basically hydrographic in nature. The Cataloging Units shown will supplant the Cataloging Units previously used by the U.S. Geological Survey in its Catalog of Information on Water Data (1966-72). The Regions, Subregions and Accounting Units are aggregates of the Cataloging Units. The Regions and Subregions are currently (1974) used by the U.S. Water Resources Council for comprehensive planning, including the National Assessment, and as a standard geographical framework for more detailed water and related land-resources planning. The Accounting Units are those currently (1974) in use by the U.S. Geological Survey for managing the National Water Data Network. (Woodard-USGS)
W76-12793

MAP SHOWING AVAILABILITY OF HYDROLOGIC DATA PUBLISHED BY THE U. S. ENVIRONMENTAL DATA SERVICE, AND BY THE U.S. GEOLOGICAL SURVEY AND COOPERATING AGENCIES, GREATER DENVER AREA, FRONT RANGE URBAN CORRIDOR, COLORADO.
Geological Survey, Denver, Colo.
E. R. Hampton.
For sale by USGS, Reston, Va, 22092, $1.25. Miscellaneous Investigations Series Map I-856-C, 1975. 1 sheet, 1 map, 41 ref.

Descriptors: *Hydrologic data, *Surface waters, *Groundwater, *Water quality, *Maps, Data collections, Sites, Bibliographies, Publications, Streamflow, Sediment transport, Water wells, *Colorado.
Identifiers: *Denver area(Colo).

This map shows types and locations of the hydrologic data published as of January 1974 for the Greater Denver Area by the U.S. Environmental Data Service and by the U.S. Geological Survey and cooperating agencies. The sources of the data are given in both the discussion and the reference. Climatological data include records of precipitation, temperature, and evaporation. Surface-water data include continuous record of stage and discharge of streams; crest-stage and low-flow discharge of streams; chemical quality of streams, lakes, and reservoirs; sediment load of streams; and stage of reservoirs. Locations of 46 surface-water data sites are shown on the map. Groundwater data sites plotted on the map represent 218 wells where water levels have been measured periodically for 4 or more years or monthly for at least 1 year, and 366 wells from which water samples have been analyzed for dissolved-chemical constituents. (Woodard-USGS)

This map report of the Greater Denver, Colo., includes data for 49 lakes that have surface greater than 10 hectares(about 25 acres). T lakes have a total combined area of 3,686 hec and a total shoreline of 185 kilometers (115 m The largest are Barr Lake, 708 hectares; Star Lake, 492 hectares; and Chatfield Lake, 465 tares. Barr Lake also has the longest shore 15.6 kilometers, and Gross Reservoir has the longest, 14.9 kilometers. In addition, 113 range in size from 2 to 10 hectares. These h total area of 526 hectares and a total shoreli 110 kilometers. Most of the lakes contain wat good quality. Most of the lakes contained that was alkaline. Slightly acidic water occ only in Marshall Lake (pH = 5.5). The highe (10.3) was measured in water from Reservoir the Rocky Mountain Arsenal grounds; Ken Reservoir was nearly as high with a pH of Values of pH of 8.5 or less occurred in 29 of t lakes measured. Transparency, as measured Secchi disk, was less than 1.2 meters in 17 51 lakes in which it was measured. It ranged 1.2 to 5.5 meters in the other 34 lakes. T parency was 5.0 meters in Gross Reservoi meters in McLellan Reservoir, and 0.5 met less in 8 of the lakes measured. (Woodard-US

ntifiers: *Lake inventory, *Colorado Springs-tle Rock area(Colo).

many lakes in Colorado's semiarid Front ge Urban Corridor are highly valued by the s' residents. In the past they were used arily to store water for irrigation and domestic . Today, rapid suburban development in the t Range Urban Corridor is accompanied by a in the principal use of many lakes to recrea-and centers of real estate development. These e lakes are threatened with a general deteriora-of chemical and biological quality caused by ging land and lake use in the area. This report ents the results of an inventory of the lakes in southern one-third of the Colorado Front ge Urban Corridor. Data on physical size are ded for most lakes of 2 hectares (20,000 re meters, about 5 acres) or greater, and r-quality data are provided for most lakes r than 5 hectares (about 12 acres). (Woodard-S)

ROLOGIC DATA FOR URBAN STUDIES HE DALLAS, TEXAS METROPOLITAN A, 1974,
gical Survey, Austin, Tex.
Hampton.
-file report, June 1976. 182 p, 4 fig, 3 tab, 7

iptors: *Hydrologic data, *Urban hydrology, n runoff, *Streamflow, *Urbanization, Data tions, Flood frequency, Gaging stations, runoff, Rainfall-runoff relationships, graphs, Mass curves, *Texas.
fiers: *Dallas metropolitan area(Tex).

eport presents the compilation and analysis drologic data collected in urban or partly drainage basins in the Dallas, Texas, politan area during the 1974 water year. The ives of the Dallas area program, which in 1961, are: (1) To determine, on the basis torical data and hydrologic analyses, the tude, frequency, and areal extent of flood-) To document and define floods of greater rdinary magnitude. (3) To determine the ef-f urban development on flood peaks and e. The studies involve the collection of itation, runoff, and flood-elevation data in inage basins within the city and 3 drainage outside the city in Dallas County. Two of drainage basins in Dallas have headwaters l areas outside the city limits, but the largest each drainage basin is within the city. The ge basins within the city include Joes Creek, an Branch, Turtle Creek, White Rock Elam Creek, Coombs Creek, Cedar Creek, le Creek, Newton Creek, and Whites . The three drainage basins outside the city las are Tenmile Creek, Duck Creek, and Mesquite Creek. (Woodard-USGS)

Descriptors: *Lakes, *Basic data collections, *Water quality, *Lake morphology, *Washington, Baseline studies, Chemical properties, Physical properties, Biological properties, Bathymetry, Maps, Aerial photography, Water temperature.

This report, the fourth in a series, contains chemical, biological, and physical data collected from 31 lakes in Washington during 1973. For each lake there is a description of the physical setting, a general discussion of water quality, a bathymetric map, and an aerial photograph. The basic data include depth profiles of dissolved-oxygen concentration and temperature. Each lake was sampled four times, from winter to late summer. In general, the study consists of a data-collection program designed to (1) document the present water quality and the overall status of the lakes, and (2) provide basic data pertaining to the physical, cultural, and water-quality characteristics of lakes in order to establish a base of reference that will allow future periodic reappraisals of lake conditions and evaluation of changes. AVAILABILITY OF GROUND WATER IN THE MIDDLE CONNECTICUT RIVER BASIN, WEST-CENTRAL NEW HAMPSHIRE,
Geological Survey, Concord, N. H.
J. E. Cotton.
Water-Resources Investigations 76-18 (open-file report), 1976. 1 sheet, 4 ref.

Descriptors: *Groundwater availability, *Water quality, *Groundwater resources, Aquifers, *New Hampshire, Maps, Hydrologic data, Water wells, Springs.
Identifiers: *Middle Connecticut River basin(NH).

This map provides a preliminary assessment of the availability of ground water in the New Hampshire part of the middle Connecticut River basin. It is a generalization of several hydrogeologic factors and provides a guideline for ground-water exploration which is useful in water- and land-use planning. The best aquifers in the basin are deposits of stratified sand or sand and gravel of Pleistocene age. Large aquifers of this type occur in the Ammonoosuc River valley (a tributary of the Connecticut River) and in valleys of tributaries to the Ammonoosuc River. Smaller aquifers occur

in the Connecticut River valley and in the valleys of other tributaries. Ground water is generally of good chemical quality. Iron and manganese in concentrations greater than the recommended limits for drinking water suggested by the U. S. Public Health Service are not uncommon. (Woodard-USGS)

COMPILING BATHYMETRY FOR FLOW SIMULATION MODELS,
Geological Survey, Reston, Va.
R. W. Schaffranek, and R. A. Baltzer.
In: Symposium on Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1329-1346, 1975. 7 fig, 5 ref.

Descriptors: *Bathymetry, *Model studies, *Flow characteristics, *Data processing, Methodology, Data collections, Deep water, Contours, Computers, Monitoring, Navigation.

A highly modular, automated bathymetric data collection and processing system has been developed by the U. S. Geological Survey in support of its modeling effort. This system permits rapid, economical collection and processing of the detailed bathymetric data required to properly schematize the bottom configuration of river, estuary, lake, reservoir and (or) coastal embayment models. The system is composed of electronic equipment used to acquire the data and a closely integrated comprehensive set of computer programs to process the data. Hardware components include a precision radio ranging unit, a depth sounder, a precision clock, a digital plotter, a digital tape recorder, and a mini-computer that controls and monitors the operation of the individual components. The computer software system is designed to process edit, verify, triangulate, collate and otherwise transform the bathymetric data into numerical arrays or graphical products in support of the modeling effort. ed are various records kept in the est Watershed Research Center's C) precipitation data file and the ng scheme for information. The collection cessing of precipitation data is part of a ensive program to study the water yield rid rangeland watersheds in the Southwest pect to conservation measures and forage on; to determine the optimum utilization yield for local and downstream needs; and t data to aid planning and designing mea- control flash flood and sediment damage. Besides precipitation data, records are also made of stream flow, vegetation and soil surveys, infiltration tests, and meteorological, geologic, geomorphic and soil moisture data. Rainfall charts collected at the Arizona and New Mexico locations are sent to the SWWRC for coding, digitizing and final processing. The system's flow of data is charted and types of field instrumentation described. Classification and other processing steps are outlined, along with a system of data quality determination. TURBULENT CHARACTERISTICS OF DRAG-REDUCING FLOWS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
C. V. Alonso, W. H. Klaus, and K. F. Wylie.
Journal of Hydraulic Research, Vol. 14, No. 2, p 103-113, 1976. 6 fig, 27 ref.

Descriptors: *Turbulent flow, *Hydraulic transportation, *Polymers, *Aqueous solutions, *Energy dissipation, Equations, Laboratory tests, Eddies, Pipe flow, Drag, Hydraulics.
Identifiers: *Interactive layer model, *Spectral densities, Dilute polymer solutions.

The reduction of frictional losses in turbulent flows of dilute polymer solutions is of particular interest to the civil engineers concerned with the hydraulic transport of solids and dredge spoil for considerable distances overland. The drag reduction is believed to result from altering of the turbulent-eddy production in dilute polymer solutions so as to make the process less dissipative. The turbulence characteristics of polymer flows were investigated in the laboratory from measurements in water and in a polyethylene oxide aqueous solution, using hot-film anemometry. Mean velocities, turbulence intensities, energy spectra, and energy-dissipation rates were measured in a turbulent smooth-pipe flow. The results of the mean flow measurements indicated that the velocity profiles follow the interactive layer model proposed earlier. The spectral data for water and polymer solutions exhibited similar inertial and dissipation subranges, although near the wall the polymer flows had a more extended inertial subrange. The addition of polymer decreased the rate of energy dissipation. The drag reducing property of the polymer additives was found to be effective only in the inner-wall region of bounded turbulent flows. (Singh-ISWS)

SWIRLING CIRCULAR TURBULENT WALL JETS,
University Coll. of Engineering, Burla (India).
B. S. Pani, and N. Rajaratnam.
Journal of Hydraulic Research, Vol. 14, No. 2, p 145-154, 1976. 13 fig, 14 ref.

Descriptors: *Velocity, *Jets, *Walls, *Shear stress, Turbulent flow, Hydraulics, Fluid mechanics, Model studies, Graphical analysis, Mathematical studies.
Identifiers: *Wall jets, Circular wall jets, *Swirl, Swirling number, Velocity profiles, Circular jets, Bed shear stress.

An experimental study of swirling circular wall jets, with the swirl number equal to 0.141 and 0.265, showed that the axial velocity profiles in the center plane are similar and are well described by the curve of the simple plane wall jet. The axial velocity distribution in the transverse direction (parellel to the wall) was also similar (in the neighborhood of the wall) and was well described by the Goertler-type solution for the circular jet. The velocity scale decreased inversely with the axial distance whereas the length scales grew linearly with the axial distance. The effect of swirl was to make the velocity scale decay faster and it also made the jet spread more rapidly in the transverse direction. The swirl also reduced the centerline bed shear stress effectively. The distribution of the bed shear stress in the transverse direction was found to be similar. (Lee-ISWS)

MAJOR JUNCTION STRUCTURE VERIFIED BY MODELING,
Santa Barbara County Water Agency, Los Angeles, Calif.
C. H. Lawrance, and M. W. Dowd.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY4, Proceedings Paper 12066, p 499-513, April 1976. 5 fig, 1 tab, 1 ref, 2 append.

Descriptors: *Colorado River, *Model studies, *Hydraulic design, *Design, *Hydraulic models, *Hydraulic structures, Costs, Flow, Pipelines, Gates, Hydraulic gates, Water supply, Water hammer, Valves, Equations.
Identifiers: Tower configuration.

Two hydraulic models of alternative configurations of a junction structure involving two large water supply conduits were tested for efficiencies in mixing of the respective supply waters and for other hydraulic characteristics under a broad range of operational conditions. An open tower configuration having two concentric, vertical tanks and an enclosed piping cross configuration were both model tested. The tower configuration was found to be more efficient in mixing and acceptable in hydraulic characteristics, provided certain baffling was provided. The engineering evaluation also favored the tower configuration, which was subsequently constructed and found to operate generally as predicted by the modeling. (Morris-ISWS)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY5, Proceedings Paper 12141, p 615-635, May 1976. 13 fig, 1 tab, 20 ref, 1 append. ONR N00014-68-A-0196-0004.

Descriptors: *Jets, *Hydraulics, *Drag, *Turbulent flow, *Mixing, Laboratory tests, Pressure, Mathematical studies, Momentum transfer, Measurement, Entrainment, Equations, Mathematics.
Identifiers: *Deflected jets, Wind tunnel experiments, Cross-flow velocity, Jet trajectories.

Experiments were carried out on a round turbulent jet with a Reynolds number of 200,000 discharged perpendicularly into crossflows in a wind tunnel. The jet-to-crossflow velocity ratio ranged from about two to nine. The drag force resulting from the pressure distribution around the jet was found to make a significant contribution to the momentum uptake by the jet only in the region just above the jet origin, while the momentum of the entrained fluid makes its principal contribution over the reach, where the jet has become fully developed, but is not yet extensively deflected. Integral-type analyses were developed, by solving the integrated equations of mass and momentum conservation and the kinematic relation, to predict jet behavior in the nearfield, curvilinear, and far field regions. The entrainment velocity was related to two components of the jet velocity relative to the crossflow velocity. The drag force on the jet was considered only in the near-field, jet dominated region. Values of the entrainment and drag coefficients were inferred from the experimental data analyzed within the framework of the analytical model. (Singh-ISWS)

Journal of the Hydraulics Division, American Society of Civil Engineering, Vol. 102, No. HY6, Proceedings Paper 12188, p 717-729, June 1976. 6 fig, 1 tab, 18 ref, 2 append. NSF ENG 75-09347, ONR N0014-67-A-0377-0027, NR 062-498.

Descriptors: *Density stratification, *Discharge(Water), *Stratification, Withdrawal, Hydraulics, Equations, Water quality, Reservoirs, Columns, Flow, Laboratory tests, Channels.
Identifiers: *Selective level releases, Criteria, Columnar disturbances, Topographical effects.

A general criterion for the presence or absence of selective withdrawal in a fluid or arbitrary stratification due to a line sink in a channel was presented. Several examples were given. The criterion was based on whether the speed of upstream propagating columnar disturbances is greater or less than the initial uniform velocity induced by the line sink. The result was then extended to topographical influence in the form of a lateral contraction of the channel walls. Experiments were conducted and they verified the conclusions for the lateral contraction. The use of lateral contractions to insure uniform flow in a stratified channel or reservoir was indicated. (Lee-ISWS)

COMPARISON OF SINGLE-POINT INJECTIONS IN PIPE FLOW,
Middle East Technical Univ., Ankara (Turkey). Dept. of Civil Engineering.
A. M. Ger, and E. R. Holley.
Journal of the Hydraulics Division, American Society of Civil Engineering, Vol. 102, No. HY6, Proceedings Paper 12172, p 731-746, June 1976. 8 fig, 1 tab, 12 ref, 2 append.

Descriptors: *Pipe flow, *Tracers, Waste disposal, Instrumentation, Hydraulics, Industrial wastes, Jets, Equations, Mixing, Flow, Mathematical studies, Concrete additives.
Identifiers: Point source, Single-point injections.

For applications such as using tracer techniques for discharge measurements in pipes or using a segment of a pipe as a mixing chamber, it is desirable to know the rate at which the concentration of injected material becomes mixed within the pipe cross section. The distance required to achieve a given degree of mixing depends on the injection system and the pipe flow characteristics. The mixing for three single-point injection systems was compared. The three systems were center line source, a wall source, and a jet at the wall issuing perpendicularly to the pipe flow. It was learned that a center line source can provide the most rapid mixing, but it is extremely difficult to maintain the symmetry necessary to achieve the rapid mixing; the wall source gives the slowest mixing; the mixing for jet injection depends on M, the ratio of the jet momentum to the pipe momentum. For a jet injection, there was an optimum M which gave the most rapid mixing for given flow characteristics, and this mixing was more rapid than either a wall source or most practically achievable center line sources. (Lee-ISWS)

CLASSIFICATION AND ANALYSIS OF RIVER PROCESSES,
R. Kellerhals, M. Church, and D. I. Bray.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY7, Proceedings Paper 12232, p 813-829, July 1976. 5 fig, 2 tab, 42 ref, 1 append.

Descriptors: *Canada, *Geomorphology, *Channel morphology, *Aerial photography, *Flood plains, Hydraulics, *Alluvial channels, Slopes, River systems, Classification, Braiding, Sediment, Meanders, Land forming.
Identifiers: *Photointerpretation, *Alberta, Channel sinuosity.

Aerial photographs and brief field visits are frequently the only data sources for the preliminary design of river engineering works in remote or undeveloped areas. Even if short-term field data are available, they may be misleading because of the nonuniform rates at which river processes take place. The major active processes are, however, reflected in the river morphology so that correct classification and interpretation of channel, floodplain, and terrace features on maps and photographs can, to some degree, overcome a lack of long-term data. Rivers present a wide spectrum of intermediate forms between the familiar cla braided and meandering types. This reflec similarly wide spectrum of flow distribution, material size, sediment transport, and channel bility. Existing river classification schemes reviewed, and a modified system was propose take account of the gradual transition betw classical types. (Lardner-ISWS)

ming, Slurries, Boreholes, Water wells.
ifiers: *Stiff foam, Lost circulation, Annular
ity, Borehole erosion, Air requirements.

ry drilling with a stiff foam is an economical
s of drilling where problems have been en-
tered with air or mud drilling techniques. The
ntages of using a stiff foam are due to the low
ty fluid which prevent lost circulation, annu-
all erosion, and good hole cleaning capabili-
when drilling in sticky clays and gravels. The
foam concept is based on 'thickening' the air
e borehole can be cleaned at a low annular
ity (200-250 feet per minute). Due to the
annular velocity a substantial reduction in
equirements and a lower annulus pressure
s. Stiff foam is made up with a concentrated
ng agent added to a high yield bentonite slur-
ormally 7 to 10 gallons of slurry is injected
ch cubic foot of hole cut. Two variations of
jection method are used with stiff foam; the
uous injection and slug injection. Control of
stem is based on surface injection pressure,
tring torque, and condition and regularity of
in the discharge pipe. Stiff foam was
ally developed for conventional rotary air
g; however, this technique also adds greatly
capability of down-the-hole hammer drilling.

NTIAL,
ld Services, Johannesburg (South Africa).
Drilling Technical Services Ltd.
obott.
of the Groundwater Association of South
st Africa, Vol. 1, No. 2, p 5-6, July, 1975. 1

Descriptors: *Drilling, *Boreholes, *Drilling equipment, *Porosity, Aquifers, Drawdown, Water wells, Groundwater, Water yield improvement.
Identifiers: *Well development, *Filtrate invasion, *Filtercake, *Aquifer damage, Drilling technique.

Inadequate aquifer development in production water well boreholes result in high well losses and consequent increased drawdown. A large number of wells which have been abandoned as dry or low yielding, in fact only require efficient aquifer development. Cable tool rig operators commonly continue drilling for long periods without baling the hole clean. This causes a large volume of fine tailings to be forced into the porous formation during the pounding action of the drill bit. Porosity is thereby reduced to a fraction of the original value. Likewise, circulation rotary drilling techniques circulate fine sand in the fluid which frequently invade porous sand aquifers. This is caused by the jetting action at the bit and the head pressure placed on the aquifer during fluid circulation. The down hole hammer method of drilling is less likely to cause aquifer damage due to the ability to flush 'fines' from the formation during drilling. With the use of revese circulation dquipment, aquifer invasion and damage can be kept to a minimum, particularly when drilling in stable hard rock environments where the circulation system can be 'starved'. The water drawn from the aquifer will flush out the cuttings. Each of these methods may be superior to the other in specific drilling situations. While damage to the aquifer is unavoidable in most cases, all reasonable care must be exercised to preclude this by proper selection of the drilling method and development technique. (Heiss-NWWA)

HOW TO DRILL A USABLE HOLE - PART 2, DESIGNING THE BOTTOMHOLE ASSEMBLY,
Drilco, Houston, Tex. Technical Services.
G. E. Wilson.
World Oil, Vol 183, No 4, p 47-51, September, 1976. 17 fig, 1 tab.

Descriptors: *Rotary drilling, *Drilling equipment, *Boreholes, *Borehole geophysics, Rock mechanics.
Identifiers: *Bottomhole assemblies, *Borehole deviations, *Packed hole theory, Pendulum theory, Drill collar design, Drill bit weighting.

Techniques are available to reduce or eliminate drill hole deviation. A popular method is to use the packed hole assembly. This method utilizes a series of stabilizers in the hole already drilled to guide the bit straight ahead. The bottom hole assembly is designed with the necessary stiffness and wall contact tools to force the bit to drill in the general direction of the hole already drilled. Design considerations given to packed hole assemblies are: tool assembly length, drill collar stiffness, clearance between the hole wall and stabilizers, and bottomhole assembly wall support. Proper design of a packed hole assembly requires that crooked hole tendencies and degree of formations drillability be considered. Crooked hole tendencies may be classed as either mild, medium or severe. Formation firmness is rated as soft to medium hard, and medium hard to hard, which is further divided into abrasive or non-abrasive. The stabilizing tools used in packed hole assemblies are of three basic types which include the rotating blade, the nonrotating rubber sleeve, the rolling cutter reamer and variations of the three. When it becomes necessary for total hole deviation to be reduced, the pendulum technique must be employed. In this technique, the pendulum length collars are swung below the regular packed hole assembly. By reducing the bit weight, bending characteristics of the drill string are changed and the hole will tend to be straighter. Recently it has been found that this is not always the best procedure because reducing the bit weight reduces penetration rate and frequently causes doglegs. (See also W76-11915) (Heiss-NWWA)

TECHNIQUES IN EVALUATING SUITABILITY OF BORROW MATERIAL FOR BEACH NOURISHMENT,
Coastal Engineering Research Center, Fort Belvoir, Va.
W. R. James.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-019 936, $5.00 in paper copy, $3.00 in microfiche. Report No. TM-60, December 1975. 81 p, 10 fig, 2 tab, 12 ref, 3 append.

Descriptors: *Beaches, *Model studies, *Erosion, *Beach erosion, Mathematical models, Shore protection, Coastal engineering, Seashores, Erosion control, Materials, Sands, Coasts, Shores.
Identifiers: *Borrow materials, Beach nourishment.

Selection of borrow material for use in beach restoration and periodic nourishment requires analysis of the textural differences between the potential borrow and native beach materials. Three quantitative techniques proposed for such analysis were reviewed and compared, and guidelines were suggested for use in planning and designing projects requiring beach nourishment. The techniques were of two types. One type was based on the assumption that sorting processes will selectively remove borrow material from the various size classes until a 'stable grain-size distribution' (gsd) is obtained and the placed fill is stabilized. The gsd of the native material was used to predict the character of the stable gsd. Methods of this type lead to calculation of a 'fill factor,' an estimate of volume of borrow material required to produce a unit volume of stable beach material. Another type of technique was based on the assumption that no material is absolutely stable, but that erosion rates depend in part on the gsd of the material exposed to existing coastal processes. Prediction of erosion rates associated with a given borrow material was based on observation of erosion rates and textural properties associated with native materials. This method resulted in a 'renourishment factor' for determining volumetric

requirements for periodic nourishment. Practical application of any of the methods is dependent on the engineering design, the historical behavior of the beach in the project area, and the techniques of handling the borrow material before and during its placement. (Sims-ISWS)

Identifiers: USSR.

A review is presented concerning questions of water supply to thermal electric power stations. The report here is concerned with graduating towers of two types: spray and dripwise. The paper is designed for water supply system design engineers and builders and thermal electric power station operating personnel and can be used as an aid by students in higher institutions of learning. SEDIMENT FLUSHING AFTER DREDGING IN TIDAL BAYS,
Royal Inst. of Tech., Stockholm (Sweden). Dept. of Hydraulics.
K. Cederwall, and T. Svensson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY7, Proceedings Paper 12229, p 935-953, July 1976. 10 fig, 3 tab, 16 ref, 2 append.

Descriptors: *Mathematical models, *Dispersion, *Dredging, *Sedimentation, Environmental engineering, Environmental effects, Estuaries, Hydraulics, Water pollution, Suspended load, Suspended solids, Bottom sampling.
Identifiers: *Sediment flushing, *One-dimensional dispersion, Dredging area, Dispersion model, Upper sediment layer, Resedimentation, Tidal flushing.

A one-dimensional dispersion model for tidal flushing of suspended material was formulated. It was suggested that this model could be used to predict the escape of suspended material from an estuarine dredging area out into the adjacent waters. The dispersion model included a sedimentation function to reproduce the effect of resedimentation. Calibration of the model was carried out in a restoration area by means of in-situ tracer tests and salinity measurements to establish the dispersive properties of the water body. The settling characteristics of the upper sediment layer were established by sedimentation analysis of bottom samples from the dredging area, divided into an organic (polluted) top layer and underlying inorganic sediment. ON HAMMERS,
Wellfield Services, Johannesburg (South Africa).
P. G. Herbert.
Journal of the Groundwater Association of South and South West Africa, Vol. 1, No. 3, p 14-15, December, 1975.

Descriptors: *Rotary drilling, *Drilling equipment, Drilling fluids, Fractures(Geology), Water wells, Boreholes, Clays.
Identifiers: *Airhammer bits, Bit weight, Bit life, Water injection, Foaming detergents, Drill string maintenance.

Constant attention to the rig while drilling and expertise at the controls will prevent a stuck hammer when using high pressure, air, rotary drilling techniques in fractured rock zones. Verticality and straightness of the borehole can be maintained by the use of large and long drill collars directly behind the hammer. Too little attention to the weight over the hammer can result in lost buttons off bits, poor bit life, broken bit shanks and even broken pistons. All of these result in lost time and money to the operator. Injection of water with a biodegradable foaming detergent at all times will prevent blowing dust, increase cooling for the hammer, aid in the returning the cuttings and help prevent lost circulation. Drilling through clays with a hammer bit is simplified by water injection, medium weight on the bit, and a relatively high speed (approximately 60 r.p.m.) rotation rate. Too much weight on the bit when drilling clays will result in 'plugging off' of the bit. Constant stripping and cleaning of air hammer bits is not necessary if care is taken in maintaining, protecting and using the bit. Maintenance includes the injection of soluable lubricating oil at all times during operation in sufficient quantities to line the inside of the drillrods. The rods should be kept clean with their threads protected at all times when not in use. Careful operation of the rig and common sense care of the downhole apparatus will give long equipment life and successful drilling while using hammer bits. (Heiss-NWWA)

WHATEVER HAPPENED TO THE HYDRAULIC RAM.
Ground Water Age, Vol. 10, No. 12, p 46, 48, 80-81, August, 1976. 4 fig.

Descriptors: *Hydraulic machinery, *Hydraulic systems, *Pumps, Hydraulic gradient, Heat pumps.
Identifiers: *Hydraulic rams.

The hydraulic ram has been used for more than 100 years for the pumping of water without the aid of any energy except the power generated by flowing water. Water is directed from a source, a stream, lake, spring or artesian well to the hydraulic ram by way of a drive pipe. When a sufficient volume of water has flowed through the waste valve to build enough pressure to close the outlet. When this occurs, the water is forced through the check valve and into the air chamber. The moving water compresses the air enclosed in the compartment so that it causes a piston-like action which closes the check valve and forces water up the delivery pipe to a storage tank for use. The device can be used to power small hydraulic electric generators as well as heat and cool buildings when used in conjunction with water-to-air heat pumps. The biggest disadvantages of the ram are: (1) the users access to a substantial amount of flowing water, (2) A sufficient drop or head difference between the water source and ram, (3) the length of intake or drive pipe from the water source to the ram, (4) the distance the water must be delivered, both horizontally and vertically. However, if conditions are right, the hydraulic ram is still the m pollution free and least expensive method getting water to run uphill. (Heiss-NWWA)

Ponding is a practical method of causing a which may heave to do so before a paveme

LIBRARY U. OF I. URBANA-CHAMPAIGN

ed rather than after. Results of observations of maintenance problems and pavement conditions were noted and an attempt was made to relate the depths of movement and effectiveness of ponding with the longer range goal of developing a method for reducing costs of roadway life. It is concluded that if the potential vertical rise ns likely to exceed one inch and the facility its it, ponding should be set up on cut and fill ions together with sand drains through the e of instability to get the moisture well into the ansive clay. Also, an evaporative seal of lime, erhaps emulsion asphalt with wide shoulders easily drained ditches, seems worthwhile. And lly, flexible asphaltic base and pavement ems seem possibly to function with the least ess and maintenance costs on these expansive s. (Sims-ISWS)

fine-grained soils, called 'dispersive' soils higher content of dissolved pore-water sodi- an ordinary soils, rapidly erode forming tun- nd deep gullies by a process in which the in- al clay particles go into suspension in slow- g water (colloidal erosion), damaging earth canals, and other structures. Dispersive annot be differentiated from ordinary soils nventional soil mechanics tests. An in- ation in which four different laboratory tests spersion were performed on a considerable er of soils of diverse origins and properties ovided improved understanding of the pro- of dispersive soils and strengthened ication criteria. High pore-water sodium is med to be the main factor causing a soil to be dispersive, although there are a few exceptional low sodium dispersive soils. The newly developed pinhole test, in which erosion is measured directly by causing water to flow through a small hole in a compacted specimen, is the most reliable single test. (Bell-Cornell)

PORE-WATER PRESSURE CHANGES DURING SOIL LIQUIFACTION,
California Univ., Berkeley. Dept. of Civil Engineering.
H. B. Seed, P. P. Martin, and J. Lysmer.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. GT4, p 323-346, April 1976. 16 fig, 3 tab, 18 ref.

Descriptors: *Earthquakes, *Pore water, *Pore pressure, Consolidation, Seepage, Vibration, Evaluation, Hydrostatic pressure, Sands, Analytical techniques, Drainage.
Identifiers: *Geotechnical engineering, *Liquefaction, Sand deposits.

An analytical procedure is presented for evaluating the general characteristics of pore-water pressure buildup and subsequent dissipation in sand deposits both during and following a period of earthquake shaking. It is shown that in layers of fine sand, excess hydrostatic pressures may persist for an hour or more after an earthquake. However, evidence of subsurface liquefaction may not appear at the ground surface until several minutes after the shaking has stopped and the critical conditions at the ground surface may not develop until 10 to 30 minutes after the earthquake. However, for coarse sands and gravels with an impedance of drainage due to the presence of sand seams or layers, pore pressures generated by earthquake shaking may dissipate so rapidly that no detrimental build-up of pore pressure or a condition approaching liquefaction can develop. Improving the drainage capability of a sand deposit may thus provide an effective means of stabilizing a potentially unstable deposit. Analyses of the type described also provide the means for assessing whether subsurface liquefaction will have any serious effects on structures supported near the ground surface. (Bell-Cornell)

EFFICIENCY-A WORLD OF FANTASY,
Australian Ground-water consultants Ltd., Sandton, Transvaal (South Africa).
M. W. Bell.
Journal of the Ground-Water Association of South and South West Africa, Vol. 1, No. 5, p 11-13, July 1976.

Descriptors: *Specifications, *Pump testing, *Groundwater, *Storage coefficient, *Yield equation, Boreholes, Water yield, Drawdown, Construction, Design, Aquifers, Water wells, Transmissivity, Permeability, Efficiencies.
Identifiers: *Borehole efficiency calculation, Radial flow, Gradient, Recovery, Hydraulic head.

The drilling specification is a document not well understood. In the forefront of the gap of understanding is the borehole efficiency clause. This clause is of immense importance as the efficiency of a pumped well determines the characteristics of the well. Good well design and construction aim to obtain a hydraulically efficient well that will give a required discharge and maintain a long life. Transmissivity, storage coefficient and drawdown are determined by hydraulic analysis, i.e., the pumping test. Efficiency must not change because of the aquifer character. The hydraulic efficiency of a well can be calculated if the hydraulic constants of transmissivity and storage are determined. These constants are determined by pumping a water well of a constant rate and measuring drawdown and/or recovery. A borehole efficiency calculation is based on the practical derivation of aquifer characteristics and it determines the damage created in installing the borehole into the aquifer. Poor drilling techniques can decrease near well permeability and increase well drawdown, and proper well development technique is required to rectify this. (Grober-NWWA)

A drilling jar consists of two connecting links, called reins, with a pin joint at the upper end and a box joint on the lower. It is placed in the tool string between the socket and drill stem to prevent the bit from sticking. Welded jars are manufactured by forming two steel billets into reins and welding

one of the open ends to a pin joint and the other to a box joint. The reins are made of selected, heat-treated alloy steel. The drop and hammer forge weldless process from one piece of ally steel is a more expensive type of jar construction; however, the heat-treated forgings gives maximum safety and long life. Jars are measured by the diameter over the reins and may be purchased with joint sizes to match the diameters. However, the jar diameter should not exceed the box collar diameter of the selected joint. To insure against the jar opening with each drilling stroke, it is important to drill with a tight line. A slack line will damage the spade ends or fatigue and crack the reins. Fishing jars are the most important fishing tool the driller uses, and should be made of good quality steel and effectively heat-treated. The weight of the stem above the jar is the effective force in jarring loose the stuck tools. The wrist pin should be adjusted to effect a short stroke, which gives better control of the tools while fishing. Fishing jars are of the same construction as drilling jars, with the exception of a much longer stroke. The long stroke allows the fishing stem to hit a heavy jar when jarring up or down, but only one way when jarring on stuck tools. Jars with a 24' or 30' stroke are commonly used in shallow wells. Jars with a 36' stroke are normally used in gas and oil fields. (Grober-NWWA)

WELL CUTTINGS ANALYSIS IN GROUNDWATER RESOURCES EVALUATION,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
W. G. Matlock, G. C. A. Morin, and J. E. Posedly.
Ground Water, Vol 14, No 5, p 272-277, September-October, 1976. 4 fig, 5 ref.

Descriptors: *Logging(Recording), *Data collections, *Water wells, *Soil analysis, Subsurface investigations, Drilling, Geologic formations, Sampling, Aquifers, Stratigraphy, Arizona.
Identifiers: *Well cuttings, Tucson(Ariz).

A standardized method for collection and analysis of well cutting samples is of immense aid in determining formation and hydrologic boundaries for the hydrogeologist in the ground-water resources evaluation of certain types of alluvial aquifers. The method standardizes collection procedures which minimize disruption of the drilling process and allows for easier laboratory interpretation. Analysis techniques for soils are adapted to differentiate between the formations encountered. Wet and dry color, particle size analysis, acid reaction, in addition to examination of mineral constituents permits correlation of formation characteristics from wells constructed at different times and by different drillers. Sanitary Landfill Leachates and Their Treatment,
W76-12930 5D

Latest U. S. Sewage Regulations,
W76-13057 5D

BIOLOGY
Spawning Littorina Littorea (L.) (Gastropoda: Prosobranchiata),
W76-12725 5C

BIOMASS
Phytoplankton Generic Diversity and Biomass Estimates of a Monogahela River Acid Confluence,
W76-12748 5C

Fluctuations of Phytoplankton Biomass and its Composition in a Subarctic Lake During Summer,
W76-12938 5C

Dynamics of Number and Biomass of Planktonic Infusoria in Open Zones of Kremenchug Reservoir and Their Production and Role in Organic Matter Destruction, (In Russian),
W76-13141 2H

Characteristics of the Primary Production in the Salmon Breeding Lake, (In Russian),
W76-13193 5C

Long-Term Changes in the Benthos Biomass of the Kuibyshev Water Storage Basin, (In Russian),
W76-13198 5C

BIORHYTHYMS
Spawning Littorina Littorea (L.) (Gastropoda: Prosobranchiata),
W76-12725 5C

BIOTA
Energy Development: The Environmental Tradeoffs. Volume 3: Relative Environmental Ranking of Proposed Offshore Continental Shelf Areas on the Basis of Impacts of Oil Spills,
W76-13039 6G

BLACK FOREST MOUNTAINS
Comparison of Required Reservoir Storages Computed by the Thomas-Fiering Model and the 'Karlsruhe Model' Type A and B,
W76-12832 4A

BLUE GRAMA
Dynamics of the Root System of Blue Grama,
W76-13123 2I

BOREHOLE DEVIATIONS
How to Drill a Usable Hole - Part 2, Designing the Bottomhole Assembly,
W76-13038 8B

BOREHOLE EFFICIENCY CALCULATION
Efficiency-A World of Fantasy,
W76-13028 8G

BOREHOLE GEOPHYSICS
How to Drill a Usable Hole - Part 2, Designing the Bottomhole Assembly,
W76-13038 8B

BOREHOLES
Efficient Aquifer Development is Necessary to Exploit Full Yield Potential,
W76-13035 8B

How to Drill a Usable Hole - Part 2, Designing the Bottomhole Assembly,
W76-13038 8B

BORROW MATERIALS
Techniques in Evaluating Suitability of Borrow Material for Beach Nourishment,
W76-13175 8B

BOTTOM SAMPLING
Ultrasonic Removal of Epilithic Algae in a Barclamp Sampler,
W76-12939 5A

BOTTOMHOLE ASSEMBLIES
How to Drill a Usable Hole - Part 2, Designing the Bottomhole Assembly,
W76-13038 8B

BOULDER-FORT COLLINS-GREELEY AREA (COLO)
Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12789 7C

BRACKISH WATER
The Role of Desalting and Brackish Water Resources in the Arid Regions of the Americas,
W76-13133 3A

BRISTOL BAY (AK)
Energy Development: The Environmental Tradeoffs. Volume 3: Relative Environmental Ranking of Proposed Offshore Continental Shelf Areas on the Basis of Impacts of Oil Spills,
W76-13039 6G

BRONZE BREAM
Feeding of the Bronze Bream of the Gorki Reservoir in the Discharge Zone of the Kostroma State Regional Electric Power Plant, (In Russian),
W76-13199 5C

BUBBLES
Heat Transfer Characteristics of a Bubble-Induced Water Jet Impinging on an Ice Surface,
W76-12998 2C

BUFFALO CREEK (GA)
Flood Plain Information, Lower Buffalo Creek and Its Tributaries, Nahunta and Brantley County, Georgia.
W76-13045 4A

BULLHEADS
Effect of Temperature on Tolerance to Dissolved Gas Supersaturation of Black Bullhead, Ictalurus Melas,
W76-12727 5C

BUOYS
Applications of Remote Sensing to Estuarin Problems,
W76-13184 2

BY PRODUCTS
Solid Waste: Is There a Profit Potential,
W76-12951 5

BYPRODUCTS
The Economics of Recovery of Materials fro Industrial Waste--A Case Study,
W76-12948 5

Environmental Control in Plants at Minimu Cost,

W76-12995 7

Occurrence of Arsenic in the Dry Creek Basi Sonoma County, California,
W76-13068 5

The Development Criteria of the Preliminar Coastal Plan,
W76-13092 2

CANADA
Osmoregulation in Trichocorixa Verticalis In teriores Sailer (Hemiptera, Corixidae) - An In

abitant of Saskatchewan Saline Lakes, anada,
76-12733 5C

pawning of Lake Whitefish, Coregonus Clu-eaformis, and Round Whitefish, Prosopium ylindraceum, in Aishihik Lake and East ishihik River, Yukon Territory,
76-12754 2H

assification and Analysis of River Processes,
76-12973 8B

nnual Report for the Year Ending March 31, 75, Saskatchewan Department of the En-ronment.
76-13052 6E

ysiological Changes During the Course of ooms of Aphanizomenon Flos-Aquae,
76-13114 5C

eld Determination of the Critical Nutrient ncentrations for Cladophora in Streams,
76-13120 5C

AL DESIGN
ape and Size of Alluvial Canals,
76-12975 8B

ALS
ape and Size of Alluvial Canals,
76-12975 8B

ARY CREEK (DEL)
atom Communities from a Delaware Salt arsh,
76-13118 5C

ACITY EXPANSION
namic Programming Model for Wastewater nt Investment,
76-13164 5D

E HATTERAS
Volumetric Temperature/Salinity Census for Middle Atlantic Bight,
76-12990 2L

BON
mulation of Denitrification in Soil Columns Adding Organic Carbon to Wastewater,
76-12920 5D

ect of Environmental Factors on otosynthesis Patterns in Phaeodactylum cornutum (Bacillariophyceae). I. Effect of rogen Deficiency and Light Intensity,
6-12942 5C

Procedure for Estimating Gross Production, Production, and Algal Carbon Content ng 14C,
6-12944 5C

BON 14
Procedure for Estimating Gross Production, Production, and Algal Carbon Content ng 14C,
6-12944 5C

BON RETENTION
ciency of Nitrogen, Carbon, and sphorus Retention by Small Agricultural ervoirs,
6-12983 4D

ONATE ROCKS
drology of Limestone Terranes, Progress of owledge About Hydrology of Carbonate anes,
6-12813 2F

CARCINOGENS
Origin, Classification and Distribution of Chemicals in Drinking Water With an Assessment of Their Carcinogenic Potential,
W76-12886 5C

The Epidemiologic Approach to the Evaluation of Water-Borne Carcinogens,
W76-12888 5C

CARIBBEAN SEA
Estimates of Socio-Economic Damages of an Oil Spill,
W76-12947 5G

CARONI SWAMP (TRINIDAD/TOBAGO)
The Social and Economic Importance of the Caroni Swamp in Trinidad and Tabago,
W76-12952 6G

CARRYING CAPACITY
Habitat Evaluation Procedures.
W76-12845 6G

CATION ADSORPTION
The Conduct of Certain Long-Lived Isotopes in Rocks in the Case of Their Contamination with Nontechnical Effluents of the Atomic Electric Power Stations (AES), (In Russian),
W76-12908 5B

CATION EXCHANGE
Geochemical Controls on Lead Concentrations in Stream Water and Sediments,
W76-12800 5A

CATIONS
Atmospheric Input of Some Cations and Anions to Forest Ecosystems in North Carolina and Tennessee,
W76-12838 2K

CAVERNOUS AQUIFER
Onset of Thermohaline Convection in a Cavernous Aquifer,
W76-12835 2F

CERAMIALES
North Carolina Marine Algae. VI. Some Ceramiales (Rhodophyta), Including a New Species of Dipterosiphonia,
W76-13025 5C

CERIUM-144
Effect of the Soil Moisture Regime on the Passage of Strontium-90, Cesium-137 and Cerium-144 from Soil into Solution, (In Russian),
W76-12868 5B

CESIUM-137
Effect of the Soil Moisture Regime on the Passage of Strontium-90, Cesium-137 and Cerium-144 from Soil into Solution, (In Russian),
W76-12868 5B

The Conduct of Certain Long-Lived Isotopes in Rocks in the Case of Their Contamination with Nontechnical Effluents of the Atomic Electric Power Stations (AES), (In Russian),
W76-12908 5B

Behavior of Cesium-137 in Soils and Soil-Plant Systems, (In Polish),
W76-12909 5B

CHANNEL FLOW
A Simplified Slope-Area Method for Estimating Flood Discharges in Natural Channels,
W76-13083 4A

CHANNEL IMPROVEMENT
Drainage Maintenance Programs in Ohio Counties,
W76-13009 4A

CHANNEL MORPHOLOGY
Classification and Analysis of River Processes,
W76-12973 8B

CHANNELS
New Diver-Operated Bedload Sampler,
W76-12972 2J

The Impact of Suburbanization on the Stream Channel Networks of Ralston Creek and South Branch, Iowa,
W76-13051 4C

CHAOBORUS
Feeding Characteristics and Predation Impact of Chaoborus (Diptera, Chaoboridae) Larvae in a Small Lake.
W76-12752 2H

CHEMICAL OXYGEN DEMAND
Raw Sewage Coagulation and Aerobic Sludge Digestion,
W76-12859 5D

CHEMICAL PRECIPITATION
Population Balance Use in Dilute Impurity Problems,
W76-12914 5B

CHEMICAL PROPERTIES
Water Quality Investigations in a Small Artificial Reservoir,
W76-12943 5C

CHEMICAL WASTES
Chemical Waste Land Disposal Facility Demonstration Grant Application.
W76-12699 5D

Effects of Chemical Pollutants on Telemediators Intervening in the Microbiological and Planktonic Ecology in a Marine Environment: III, (In French),
W76-12922 5C

CHEMISTRY
Environmental Status of the Lake Michigan Region, Volume 3. Chemistry of Lake Michigan,
W76-12695 5C

CHERNOZEMS
Investigations on the Water Regime of the Main Soil Types of the Cris River Plain, (In Romanian),
W76-12856 2G

CHESAPEAKE BAY
Applications of Remote Sensing to Estuarine Problems,
W76-13184 2L

CHILLICOTHE (OH)
Flood Plain Information: Scioto and Olentangy Rivers, Ohio, Chillicothe Area Summary Report,
W76-13046 4A

CHLORELLA FUSCA
Regulation of Nitrate Assimilation by Amino Acids in Chlorella,
W76-13119 5C

CHLORIDE-36
Solute Dispersion in Saturated Soil Columns,
W76-12986 5B

CHLORINATION
The Environmental Impact of Water Chlorination.
W76-12876 5C

Current Chlorination and Dechlorination Practices in the Treatment of Potable Water, Wastewater, and Cooling Water,
W76-12877 5D

The Chemistry of Aqueous Chlorine in Relation to Water Chlorination,
W76-12878 5C

Measurement and Persistence of Chlorine Residuals in Natural Waters,
W76-12879 5A

Organo-Chemical Implications of Water Chlorination,
W76-12880 5C

Chlorination of Organics in Drinking Water,
W76-12881 5C

Analysis of New Chlorinated Organic Compounds Formed by Chlorination of Municipal Wastewater,
W76-12883 5A

Chemistry of Halogens in Seawater,
W76-12884 5A

The Potential for Increased Mutagenic Risk to the Human Population Due to the Products of Water Chlorination,
W76-12887 5C

A Review of the Impact of Chlorination Processes Upon Marine Ecosystems,
W76-12890 5C

Chlorinated Compounds Found in Waste-Treatment Effluents and Their Capacity to Bioaccumulate,
W76-12891 5A

Investigating the Effects of Chlorinated Organics,
W76-12892 5C

A Kinetic Model for Predicting the Composition of Chlorinated Water Discharged from Power Plant Cooling Systems,
W76-12894 5C

Assessing Toxic Effects of Chlorinated Effluents on Aquatic Organisms: A Predictive Tool,
W76-12895 5C

Viruses in Waste, Renovated, and Other Waters. 1974 Literature Abstracts,
W76-13095 5D

Optimal Design of Chlorination Systems,
W76-13163 5F

CHLORINE
Some Effects of Temperature, Chlorine and Copper on the Survival and Growth of the Coon Stripe Shrimp, Pandalus Danae,
W76-12722 5C

The Chemistry of Aqueous Chlorine in Relation to Water Chlorination,
W76-12878 5C

Measurement and Persistence of Chlorine Residuals in Natural Waters,
W76-12879 5A

Organo-Chemical Implications of Water Chlorination,
W76-12880 5C

Chemistry of Halogens in Seawater,
W76-12884 5A

The Toxicity of Chlorine to Freshwater Organisms Under Varying Environmental Conditions,
W76-12889 5C

Modeling Residual Chlorine Levels: Closed Cycle Cooling Systems,
W76-12893 5C

Effects of Chlorine and Sulfite Reduction on Lake Michigan Invertebrates,
W76-13113 5C

CHLORINE COMPOUNDS
Optimal Design of Chlorination Systems,
W76-13163 5F

CHLOROPHYLL
Water Quality Model of a Salt-Wedge Estuary,
W76-13063 5B

CHLOROPHYTA
Regulation of Nitrate Assimilation by Amino Acids in Chlorella,
W76-13119 5C

CICHLIDS
The Ability of the Cichlid Fishes Tilapia Rendalle Boulenger, Tilapia Sparrmanii A. Smith and Hemihaplochromis (Pseudocrenilabrus) Philander (M. Weber) to Enter Deep Water,
W76-12759 5C

CITIES
More Water: One City's Plan,
W76-13097 6D

CITY PLANNING
Does Water Use Restrict the Location of Industrial Air Polluters,
W76-12950 5G

CLADOPHORA
Field Determination of the Critical Nutrient Concentrations for Cladophora in Streams,
W76-13120 5C

CLAMS
Reproduction and Recruitment of the Brackish Water Clam Rangia Cuneata in the James River, Virginia,
W76-12728 5C

CLAYS
Chemical and Plant Extractability of Metals and Plant Growth on Soils Amended with Sludge,
W76-12929 5B

Identification and Nature of Dispersive Soils,
W76-13170 8D

CLEAN WATER BILL
Sewage Effluent Turned to Snow: Provides Storage, Removes Pollutants,
W76-13048 5D

CLIMATOLOGICAL ENVIRONMENT
Methodology for the Selection and Application of Probability Models for the Simulation of Daily Rainfall and Runoff,
W76-12994 7A

CLIMATOLOGY
Recent Cyclic Changes in Climate and in Abundance of Marine Life,
W76-12747 5C

Geomorphology and Climatology of Ari Watersheds,
W76-13135 2A

CLOUD PHYSICS
Comparison Study of Models used to Prescrib Hydrometeor Water Content Values, Part I Preliminary Results,
W76-13172 2B

The Continuous Aluminum-Foil Hydrometeo Sampler; Design, Operation, Data Analysi Precedures, and Operating Instructions,
W76-13173 2B

Mesometeorological Studies of Precipitation,
W76-13186 2B

CLUSTER ANALYSIS
A Cluster Analysis of Activity, Frequency, an Environment Variables to Identify Wate Based Recreation Types,
W76-12955 6

COAL MINE WASTES
Effect of Suspended Coal Particles on Lif Forms of Aquatic Moss Eurhynchiu Riparioides (HEDW): II. The Effect on Spo Germination and Regeneration of Apical Tips,
W76-12913 5

COAL MINES
Tioga River Mine Drainage Abatement Project
W76-12874 5

COASTAL ENGINEERING
Coastal Dispersion of Pollutants,
W76-12843 5

Annotated Bibliography on the Geologi Hydraulic, and Engineering Aspects of Tid Inlets,
W76-12999 2

COASTAL FISHERIES MANAGEMENT
The Role of Interstate Compacts in Fisheri Management,
W76-13107 6

COASTAL PLAINS
The Coastal Plains Regional Commission–U.S Geological Survey. Aeromagnetic-Aeroradioa tivity Survey,
W76-13099 7

COASTAL ZONE MANAGEMENT
The Virginia Institute of Marine Science, Vi ginia's Marine Science, Engineering, Educ tion, and Advisory Services Program,
W76-13100 6

Legal Aspects of Public Access to Beaches,
W76-13104 6

Back Bay National Wildlife Refuge. Son Parallels in Implementing the Coastal Zon Management Act,
W76-13105 6

Freeing the Beaches: Is It Possible,
W76-13106 6

COASTAL ZONE PLANNING (CALIF)
The Development Criteria of the Preliminar Coastal Plan,
W76-13092 2

COASTS
Surface Water Temperatures at Shore Station United States West Coast, 1973.
W76-12995 7

Annotated Bibliography on the Geologic, Hydraulic, and Engineering Aspects of Tidal Inlets,
W76-12999 2L

A Water-Quality Simulation Model for Well Mixed Estuaries and Coastal Seas: Volume VIII, an Engineering Assessment,
W76-13093 2L

An ERTS-1 Study of Coastal Features on the North Carolina Coast,
W76-13174 7B

Basic Investigations for Remote Sensing of Coastal Areas,
W76-13182 2L

Basic Investigations for Remote Sensing of Coastal Areas,
W76-13183 2L

BALT-60
The Conduct of Certain Long-Lived Isotopes in Rocks in the Case of Their Contamination with Biontechnical Effluents of the Atomic Electric Power Stations (AES), (In Russian),
W76-12908 5B

BCCI
Quantitative Dynamics of Bacteria in the Kremenchug Reservoir, (In Russian),
W76-13195 5C

BIOFISH
Iceland's Winter Cod Catch Shows Serious Decline,
W76-12966 6C

BOHO SALMON
Relation of Water Temperature to Ceratomyxosis in Rainbow Trout (Salmo Gairdneri) and Coho Salmon (Oncorhynchus Kisutch),
W76-12716 5C

COLIFORMS
Study on the Efficiency of Four Procedures for Enumerating Coliforms in Water,
W76-12897 5A

Effect of the Operating Conditions of Recycling Water Supply Systems on the Quality of Reused Waste Waters, (In Russian),
W76-12907 5C

A Water-Quality Simulation Model for Well Mixed Estuaries and Coastal Seas: Volume VIII, an Engineering Assessment,
W76-13093 2L

COLIPHAGES (AIR BORNE)
Airborne Coliphages from Wastewater Treatment Facilities,
W76-12921 5A

COLLAGEN
Thermal Transitions of Collagen From Fish Recovered From Different Depths,
W76-12760 5C

COLORADO
Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Colorado Springs-Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12787 7C

Land-Use Classification Map of the Colorado Springs--Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12788 7C

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12789 7C

Land-Use Classification Map of the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12790 7C

Map Showing Availability of Hydrologic Data Published by the U. S. Environmental Data Service, and by the U.S. Geological Survey and Cooperating Agencies, Greater Denver Area, Front Range Urban Corridor, Colorado.
W76-12794 7C

Map Showing Lakes in the Greater Denver Area Front Range Urban Corridor, Colorado,
W76-12795 7C

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Greater Denver Area, Front Range Urban Corridor, Colorado,
W76-12796 7C

Lakes in the Colorado Springs--Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12797 7C

Sewage Effluent Turned to Snow: Provides Storage, Removes Pollutants,
W76-13048 5D

Drought Resistance of Blue Grama as Affected by Atrazine and N. Fertilizer,
W76-13122 2I

Dynamics of the Root System of Blue Grama,
W76-13123 2I

COLORADO RIVER
Major Junction Structure Verified by Modeling,
W76-12840 8B

COLORADO SPRINGS-CASTLE ROCK AREA (COLO)
Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Colorado Springs-Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12787 7C

Lakes in the Colorado Springs--Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12797 7C

COLUMBIA RIVER
Studies of Columbia River Water Quality Development of Mathematical Models for Sediment and Radionuclide Transport Analysis,
W76-12702 5B

COLVILLE RIVER DELTA (ALASKA)
Changes Occurring in the Oceanic Portion of the Colville River Delta, Alaska, During Spring Flooding,
W76-12997 2C

COMBINED SEWERS
Computer Halts Flooding Complaints,
W76-12905 5D

COMMERCIAL FISHING
How Sri Lanka Plans to Develop Her Fishing Industry,
W76-12957 6B

COMMUNITY DEVELOPMENT
Impacts of Recreational Development: The Voyager Village Experience,
W76-12965 6B

COMPUTER MODELS
Lake George Site Synthesis, 1974-1975.
W76-12937 5C

Establishing Water, Nutrient and Total Solids Mass Budgets for a Gravity-Irrigated Farm,
W76-13015 3F

Finite-Difference Model for Aquifer Simulation in Two Dimensions with Results of Numerical Experiments,
W76-13085 2F

COMPUTER PROGRAMS
HTPGB1: A Computer Program for Calculating from Experimental Data the Variation in Heat Transfer Coefficient Round a Cylindrical Surface,
W76-12687 7C

Computer Halts Flooding Complaints,
W76-12905 5D

Interdisciplinary Applications and Interpretation of EREP Data Within the Susquehanna River Basin,
W76-13188 7B

CONDUCTIVITY FLOW METER
A Conductivity Flow Meter,
W76-12825 7B

CONFERENCES
Combined Effects on the Environment of Radioactive, Chemical and Thermal Releases from the Nuclear Industry, (Report on the International Symposium Held in Stockholm June 2-5, 1975),
W76-12765 5C

The Environmental Impact of Water Chlorination.
W76-12876 5C

CONSERVATION
The Social and Economic Importance of the Caroni Swamp in Trinidad and Tabago,
W76-12952 6G

Conservation: EESG Bibliography Series:16,
W76-12953 6B

The Development Criteria of the Preliminary Coastal Plan,
W76-13092 2L

Back Bay National Wildlife Refuge. Some Parallels in Implementing the Coastal Zone Management Act,
W76-13105 6E

CONTINENTAL SHELF
A Volumetric Temperature/Salinity Census for the Middle Atlantic Bight,
W76-12990 2L

Energy Development: The Environmental Tradeoffs. Volume 3: Relative Environmental Ranking of Proposed Offshore Continental Shelf Areas on the Basis of Impacts of Oil Spills,
W76-13039 6G

Possible Effects of Construction and Operation of a Supertanker Terminal on the Marine Environment in the New York Bight,
W76-13089 6G

CONTINENTAL SHELF

Onshore Impacts of Oil and Gas Development in Alaska, Volume I.
W76-13090 5G

Onshore Impacts of Oil and Gas Development in Alaska. Volume II. Methodology Appendices.
W76-13091 5G

CONTROL SYSTEMS
Tritium Effluent Control Project, Progress Report: July - September 1975,
W76-12779 5D

Tritium Effluent Control Project, Progress Report: January - March 1975,
W76-12780 5D

Tritium Effluent Control Project, Progress Report: October - December 1974,
W76-12781 5G

Tritium Effluent Control Project, Progress Report: April - June 1975,
W76-12782 5G

CONVECTION
Onset of Thermohaline Convection in a Cavernous Aquifer,
W76-12835 2F

COOK INLET (AK)
Energy Development: The Environmental Tradeoffs. Volume 3: Relative Environmental Ranking of Proposed Offshore Continental Shelf Areas on the Basis of Impacts of Oil Spills,
W76-13039 6G

COOLING TOWERS
Site and Design Temperature Related Economics of Nuclear Power Plants with Evaporative and Non-Evaporative Cooling Tower Systems,
W76-12784 6G

Turbulent Bed Cooling Tower,
W76-12847 5D

Analysis of Multiple Cell Mechanical Draft Cooling Towers,
W76-12848 5C

COOLING WATER
An Analytical Method for Determining Heat Transfer from Power Plant Coolant in the Florida Boulder Zone,
W76-12777 5B

COORDINATION
Public Participation in Water Resources Planning: An Evaluation of the Programs of 15 Corps of Engineer Districts-Summary of Evaluation and Recommendations,
W76-13041 6E

COPEPODS
Occurrence, Viability and Significance of Resting Eggs of the Calanoid Copepod Labidocera Aestiva,
W76-12737 6G

An Estimation of Total Production of Planktonic Copepods in Neritic Zone of the Golfe Dulion (Banyuls-Sur-Mer): I. Quantitative Annual Variation, (In French),
W76-12954 5C

COPPER
Some Effects of Temperature, Chlorine and Copper on the Survival and Growth of the Coon Stripe Shrimp, Pandalus Danae,
W76-12722 5C

Concentrations of Mercury, Cadmium, Lead and Copper in the Surrounding Seawater and in Seaweeds, Undaria Pinnatifida and Sargassum Fulvellum, from Suyeong Bay in Pusan, (In Korean),
W76-13190 5A

CORALVILLE RESERVOIR (IA)
Public Evaluation of Water Quality and Its Impact on Recreation: A Case from Iowa,
W76-13050 5G

CORN (FIELD)
Water use by Dryland Corn as Affected by Maturity Class and Plant Spacing,
W76-13124 3F

Genotype Variation in Nutrient Uptake Efficiency in Corn,
W76-13134 3F

CORRUGATED PLASTIC PIPE
Deflection-Stiffness Characteristics of Corrugated Plastic Tubing,
W76-13018 4A

COST ALLOCATION
Development of Residuals Management Strategies: An Executive Summary,
W76-13054 5G

COST ANALYSIS
Meadow/Marsh Systems as Sewage Treatment Plants,
W76-12753 5D

Site and Design Temperature Related Economics of Nuclear Power Plants with Evaporative and Non-Evaporative Cooling Tower Systems,
W76-12784 6G

COST-BENEFIT ANALYSIS
Correlation of Radioactive Waste Treatment Costs and the Environmental Impact of Waste Effluents in the Nuclear Fuel Cycle for Use in Establishing as Low as Practicable Guides-Fabrication of Light-Water Reactor Fuels Containing Plutonium,
W76-12694 5C

Value Engineering: Make Sure The Costs Are Right,
W76-12906 5D

Conservation: EESG Bibliography Series:16,
W76-12953 6B

COST MINIMIZATION
Optimal Design of Chlorination Systems,
W76-13163 5F

Optimal Design of Wastewater Collection Systems,
W76-13165 5D

COST SHARING
Development of Residuals Management Strategies: An Executive Summary,
W76-13054 5G

COSTS
The Impact of Increased Fuel Costs and Inflation on the Cost of Desalting Sea Water and Brackish Waters,
W76-12778 3A

More Water: One City's Plan,
W76-13097 6D

GALVESTON BAY (TEX)
Seasonal Abundance and Distribution of Marine Fishes at a Hot-Water Discharge in Galveston Bay, Texas,
W76-12718 5C

GAMMARUS CHEVREUXI
Simulation Experiments on the Migration of Gammarus Zaddachi and Gammarus Chevreuxi,
W76-12724 5C

GAMMARUS SP
The Effects of Power Plant Condenser Cooling Water Entrainment on the Amphipod, Gammarus SP.,
W76-12768 5C

GAMMARUS ZADDACHI
Simulation Experiments on the Migration of Gammarus Zaddachi and Gammarus Chevreuxi,
W76-12724 5C

GAS BUBBLE DISEASE
Effect of Temperature on Tolerance to Dissolved Gas Supersaturation of Black Bullhead, Ictalurus Melas,
W76-12727 5C

GASES
Effect of Temperature on Tolerance to Dissolved Gas Supersaturation of Black Bullhead, Ictalurus Melas,
W76-12727 5C

Mogden, Where Sewage Works,
W76-12923 5D

GASTROPODS
Spawning Littorina Littorea (L.) (Gastropoda: Prosobranchiata),
W76-12725 5C

GEOCHEMISTRY
Geochemical Controls on Lead Concentrations in Stream Water and Sediments,
W76-12800 5A

GEOLOGIC MAPPING
Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Colorado Springs-Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12787 7C

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12789 7C

GEOLOGIC MAPPING

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Greater Denver Area, Front Range Urban Corridor, Colorado,
W76-12796 7C

GEOMORPHOLOGY
Classification and Analysis of River Processes,
W76-12973 8B

Geomorphology and Climatology of Arid Watersheds,
W76-13135 2A

GEOPHYSICAL METHODS
Groundwater Geophysics in South Africa,
W76-13027 4B

GEOPHYSICS
Groundwater Geophysics in South Africa,
W76-13027 4B

GEORGIA)
Flood Plain Information, Lower Buffalo Creek and Its Tributaries, Nahunta and Brantley County, Georgia.
W76-13045 4A

GEOTECHNICAL ENGINEERING
Identification and Nature of Dispersive Soils,
W76-13170 8D

Pore-Water Pressure Changes During Soil Liquifaction,
W76-13171 8D

GEOTHERMAL STUDIES
Onset of Thermohaline Convection in a Cavernous Aquifer,
W76-12835 2F

Water Required to Develop Geothermal Energy,
W76-13030 3E

Geothermal Energy System Heat Exchanger and Control Apparatus,
W76-13139 4B

GERMINATION
The Vegetation of Dune Slacks at Newborough Warren: III. Plantago Coronopus,
W76-12911 3C

GIBBERELLIC ACID
The Influence of Gibberellic Acid and Kinetin on the Growth of Scenedesmus Quadricauda (Turp.) Breb.,
W76-12941 5C

GILA RIVER TEST SITE (ARIZ)
Quantitative Relationship Between Reflectance and Transpiration of Phreatophytes--Gila River Test Site,
W76-12802 2D

GOATS
Water Economy and Drinking Regime of the Bedouin Goat,
W76-13125 3C

GORGODERIDAE
Studies on Helminths of North Dakota: V. Life History of Phyllodistomum Nocomis Fischthal, 1942 (Trematoda:Gorgoderidae),
W76-12912 2I

GORKI RESERVOIR (USSR)
Feeding of the Bronze Bream of the Gorki Reservoir in the Discharge Zone of the Kostroma State Regional Electric Power Plant, (In Russian),
W76-13199 5C

GRAIN SORGHUM
Trickle and Sprinkler Irrigation of Grain Sorghum,
W76-13003 3F

GRAMA GRASSES
Drought Resistance of Blue Grama as Affected by Atrazine and N. Fertilizer,
W76-13122 2I

Dynamics of the Root System of Blue Grama,
W76-13123 2I

GRAND RIVER BASIN (MICH)
A Hypothesis of Ion Filtration in a Potable-Water Aquifer System,
W76-12803 4B

GRAPHICAL ANALYSIS
An Analysis of the Errors Associated with the Determination of Atmospheric Temperature from Atmospheric Pressure and Density Data,
W76-13179 2B

GRAVEL PACK DESIGN
Engineered Irrigation Wells.
W76-13033 4B

GRAVELS
Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Colorado Springs-Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12787 7C

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12789 7C

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Greater Denver Area, Front Range Urban Corridor, Colorado,
W76-12796 7C

GRAVITY STUDIES
Groundwater Geophysics in South Africa,
W76-13027 4B

GREAT DIVIDE BASINS (WYO)
A Plan for Study of Water and Its Relation to Economic Development in the Green River and Great Divide Basins in Wyoming,
W76-12805 6D

GREAT LAKES
Great Lakes Research Division, Chronology of Research: 1950 to the Present.
W76-12815 2H

Benefits of an Extended Season: The Experiences of One Industrial User,
W76-12956 6B

Emission of Sulfur from Lake Ontario Sediments,

IRRIGATION EFFICIENCY
Combined Irrigation and Fertilization of Tomatoes Grown on Sand Dunes,
W76-13127 3C

Irrigation System Controller,
W76-13137 3F

Lawn Sprinkling and Similar Installations,
W76-13157 3F

Lawn, Farm, and Orchard Sprinklers,
W76-13158 3F

IRRIGATION ENGINEERING
Irrigation Reuse Systems--A Proposed New ASAE Engineering Practice,
W76-13016 3C

IRRIGATION PRACTICES
Some Historical Data on the Antiquity of Soil Irrigation in the Azerbaijan SSR, (In Russian),
W76-12917 3F

Trickle and Sprinkler Irrigation of Grain Sorghum,
W76-13003 3F

Reduced Irrigation Tailwater Runoff for Increased Water-Use Efficiency,
W76-13008 3F

Meeting Future Water Requirements by Water Conservation,
W76-13013 3F

Establishing Water, Nutrient and Total Solids Mass Budgets for a Gravity-Irrigated Farm,
W76-13015 3F

Irrigation Reuse Systems--A Proposed New ASAE Engineering Practice,
W76-13016 3C

IRRIGATION SCHEDULING
Irrigation Scheduling and Sugarbeet Production,
W76-13002 3F

IRRIGATION SYSTEMS
Irrigation Reuse Systems--A Proposed New ASAE Engineering Practice,
W76-13016 3C

Irrigation System Controller,
W76-13137 3F

IRRIGATION WATER
Engineered Irrigation Wells.
W76-13033 4B

IRRIGATION WELLS
Engineered Irrigation Wells.
W76-13033 4B

ISOLATION
Isolating Organic Water Pollutants: XAD Resins Urethane Foams, Solvent Extraction,
W76-12873 5A

ISOMERS
Characteristics of the Toxic Effect of Propylphenol Isomers and their Safe Level in Water Bodies, (In Russian),
W76-12850 5

ISOTOPE STUDIES
The Conduct of Certain Long-Lived Isotopes in Rocks in the Case of Their Contamination with Nontechnical Effluents of the Atomic Electric Power Stations (AES), (In Russian),
W76-12908

ISRAEL
Planning for Water Recreation in Israel,
W76-12959

JAMES RIVER ESTUARY (VA)
Reproduction and Recruitment of the Brackish Water Clam Rangia Cuneata in the James River, Virginia,
W76-12728

JAMES RIVER (VA)
Broadband Spectral Photography of the James River,
W76-13180

JETS
Field Observation of the Dynamics of Heat Discharge Jets,
W76-12775

Swirling Circular Turbulent Wall Jets,
W76-12828

Entrainment and Drag Forces of Deflected Jets,
W76-12969

Heat Transfer Characteristics of a Bubble-Induced Water Jet Impinging on an Ice Surface,
W76-12998

JUNIATA RIVER WATERSHED (PENN)
Preimpoundment Water Quality of Raystown Branch Juniata River and Six Tributary Streams, South-Central Pennsylvania,
W76-13065

KANSAS
Flood Plain Information: Verdigris, Fall and Elk Rivers, Kansas.
W76-13047

KARLSRUHE MODEL
Comparison of Required Reservoir Storage Computed by the Thomas-Fiering Model and the 'Karlsruhe Model' Type A and B,
W76-12832

KARST
Hydrology of Limestone Terranes, Progress in Knowledge About Hydrology of Carbonate Terranes,
W76-12813

KARST HYDROLOGY
Hydrology of Limestone Terranes, Progress in Knowledge About Hydrology of Carbonate Terranes,
W76-12813

KENTUCKY
Water Resources Data for Kentucky, Water Year 1975.
W76-13075

KIEL BIGHT
Qualitative and Quantitative Salmonella Investigations and their Hygienic Valuation in Connection with E. Coli Titre, Demonstr

with Examples from the Coastal Waters of Kiel Bight (Western Baltic Sea), (In German),
W76-13140 5A

KINEMATIC WAVE EQUATION
A Note on the Step Error of Some Finite-Difference Schemes Used to Solve Kinematic Wave Equations,
W76-12834 2E

KINETICS
How To Design Aerated Lagoon Systems to Meet 1977 Effluent Standards - Evaluation of Kinetic Coefficients,
W76-12903 5D

KINETIN
The Influence of Gibberellic Acid and Kinetin on the Growth of Scenedesmus Quadricauda (Turp.) Breb.,
W76-12941 5C

KOTZEBUE SOUND (AK)
Energy Development: The Environmental Tradeoffs. Volume 3: Relative Environmental Ranking of Proposed Offshore Continental Shelf Areas on the Basis of Impacts of Oil Spills,
W76-13039 6G

KREMENCHUG RESERVOIR (USSR)
Quantitative Dynamics of Bacteria in the Kremenchug Reservoir, (In Russian),
W76-13195 5C

KUIBYSHEV RIVER BASIN (USSR)
Long-Term Changes in the Benthos Biomass of the Kuibyshev Water Storage Basin, (In Russian),
W76-13198 5C

LABIDOCERA AESTIVA
Occurrence, Viability and Significance of Resting Eggs of the Calanoid Copepod Labidocera Aestiva,
W76-12737 6G

LABORATORIES
Handbook for Evaluating Water Bacteriological Laboratories,
W76-12869 5A

LABORATORY EQUIPMENT
Temperature Responses of a Coccolithophorid, Cricosphaera Carterae, Measured in a Simple and Inexpensive Thermal-Gradient Device,
W76-12764 5A

Laboratory Evaluation of Polymeric Flocculants,
W76-12898 5D

LABORATORY TESTS
Effects of Temperature on Oil Refinery Waste Toxicity,
W76-12711 5C

Osmoregulation in Trichocorixa Verticalis Interiores Sailer (Hemiptera, Corixidae) - An Inhabitant of Saskatchewan Saline Lakes, Canada,
W76-12733 5C

Effects of Acclimatization and Physiological State on the Tolerance to High Temperatures and Reactions to Desiccation of Theodoxus fluviatilis and Lymnea Peregra,
W76-12741 5C

Toxicity of Natural Pyrethrins and Five Pyrethroids to Fish,
W76-12742 5C

Laboratory Evaluation of Polymeric Flocculants,
W76-12898 5D

LACEY FORMULAS
Shape and Size of Alluvial Canals,
W76-12975 8B

LAKE BANGWEULU (ZAMBIA)
Annulus Formation and Growth of Tigerfish, Hydrocynus Vittatus, in Lake Bangweulu, Zambia,
W76-12767 5C

LAKE COUNTY (ILL)
Public Groundwater Supplies in Lake County,
W76-12824 4B

LAKE CURRENTS
Near Shore Lake Current Investigations,
W76-12774 5B

LAKE ERIE
Remote Sensing Study of Maumee River Effects on Lake Erie,
W76-12819 5A

LAKE GEORGE (NY)
Lake George Site Synthesis, 1974-1975.
W76-12937 5C

LAKE GEORGE VILLAGE (NY)
Seasonal Variations in the Purification of Treatment Plant Effluent in Natural Sand Deposits,
W76-13121 5D

LAKE INVENTORY
Lakes in the Colorado Springs--Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12797 7C

LAKE MICHIGAN
Bluff Erosion, Recession Rates, and Volumetric Losses on the Lake Michigan Shore in Illinois,
W76-12686 2J

Environmental Status of the Lake Michigan Region, Volume 3. Chemistry of Lake Michigan,
W76-12695 5C

Nearshore Currents at Point Beach, Wisconsin (1974-1975),
W76-12758 7B

Measurements of Physical Phenomena Related to Power Plant Waste Heat Discharges: Lake Michigan, 1973 and 1974,
W76-12770 5B

Thermal Plume Mapping,
W76-12771 5B

Measurements of Eddy Diffusivities in Nearshore Regions of Lake Michigan,
W76-12772 5B

A Comparison of Aerial Infrared and Boat Oriented Thermal Plume Measurement Techniques,
W76-12773 5B

Field Observation of the Dynamics of Heated Discharge Jets,
W76-12775 5B

Site and Design Temperature Related Economics of Nuclear Power Plants with Evaporative and Non-Evaporative Cooling Tower Systems,
W76-12784 6G

Pollutant Aerosol Deposition into Southern Lake Michigan,
W76-12935 5B

Inputs of Phosphorus from Precipitation to Lake Michigan,
W76-13112 5B

Effects of Chlorine and Sulfite Reduction on Lake Michigan Invertebrates,
W76-13113 5C

LAKE MORPHOLOGY
Map Showing Lakes in the Greater Denver Area Front Range Urban Corridor, Colorado,
W76-12795 7C

Data on Selected Lakes in Washington, Part 4,
W76-12808 7C

LAKE MORPHOMETRY
Map Showing Lakes in the Greater Denver Area Front Range Urban Corridor, Colorado,
W76-12795 7C

LAKE ONTARIO
Emission of Sulfur from Lake Ontario Sediments,
W76-12987 2J

LAKE ONTARIO BASIN
Emission of Sulfur from Lake Ontario Sediments,
W76-12987 2J

LAKE ONTARIO SEDIMENTS
Emission of Sulfur from Lake Ontario Sediments,
W76-12987 2J

LAKE SEDIMENTS
Emission of Sulfur from Lake Ontario Sediments,
W76-12987 2J

LAKE SHORES
Bluff Erosion, Recession Rates, and Volumetric Losses on the Lake Michigan Shore in Illinois,
W76-12686 2J

Nearshore Currents at Point Beach, Wisconsin (1974-1975),
W76-12758 7B

Near Shore Lake Current Investigations,
W76-12774 5B

Impacts of Recreational Development: The Voyager Village Experience,
W76-12965 6B

LAKE SUPERIOR
Sublacustrine Fan Morphology in Lake Superior,
W76-13079 5B

LAKES
Map Showing Lakes in the Greater Denver Area Front Range Urban Corridor, Colorado,
W76-12795 7C

Lakes in the Colorado Springs--Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12797 7C

Data on Selected Lakes in Washington, Part 4,
W76-12808 7C

Lake George Site Synthesis, 1974-1975.
W76-12937 5C

Fluctuations of Phytoplankton Biomass and its Composition in a Subarctic Lake During Summer,
W76-12938 5C

Surface Water Supply of the United States, 1966-70: Part 5. Hudson Bay and Upper Mississippi River Basins--Volume 2. Upper Mississippi River Basin Above Keokuk, Iowa.
W76-13076 7C

Digital Models of a Glacial Outwash Aquifer in the Pearl-Sallie Lakes Area, West-Central Minnesota,
W76-13082 2F

Characteristics of the Primary Production in the Salmon Breeding Lake, (In Russian),
W76-13193 5C

LAND APPLICATION
Land Application of Wastewater, (Literature Review),
W76-12676 5D

LAND CLASSIFICATION
Land-Use Classification Map of the Colorado Springs--Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12788 7C

Land-Use Classification Map of the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12790 7C

LAND DEVELOPMENT
Map of Rock Types in Bedrock of Allegheny County, Pennsylvania,
W76-12791 7C

LAND RECLAMATION
Aspects of Soil Salinity and Sodicity in Relation to Irrigation and Reclamation,
W76-13126 3C

LAND USE
Land-Use Classification Map of the Colorado Springs--Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12788 7C

Land-Use Classification Map of the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12790 7C

Ground-Water Quality Variation in Phelps County, Missouri,
W76-12991 5B

Urban Hydrology for Small Watersheds.
W76-13044 4C

Onshore Impacts of Oil and Gas Development in Alaska. Volume II. Methodology Appendices.
W76-13091 5G

The Development Criteria of the Preliminary Coastal Plan,
W76-13092 2L

LANDFILLS
Sanitary Landfill Leachates and Their Treatment,
W76-12930 5D

Solid Wastes and Water Quality, (Literature Review),
W76-12933 5E

Sanitary Landfill Stabilization with Leachate Recycle and Residual Treatment,
W76-13187 5E

LARVAE
Some Current Directed Movements of Macrobrachium Acanthurus (Wiegmann 1836) (Decapoda, Palaemonidae) under Laboratory Conditions,
W76-12707 2L

LAS VEGAS VALLEY (NEV)
A Brief Hydrologic Appraisal of the July 3-4, 1975, Flash Flood in Las Vegas Valley, Nevada.
W76-12806 4A

LATITUDINAL STUDIES
Latitudinal Variation in the Life History Features of the Black Turban Snail Tegula Funebralis (Prosobranchia: Trochidae),
W76-12751 5C

LEACHATE
Sanitary Landfill Leachates and Their Treatment,
W76-12930 5D

Solid Wastes and Water Quality, (Literature Review),
W76-12933 5E

LEACHATE RECIRCULATION
Sanitary Landfill Stabilization with Leachate Recycle and Residual Treatment,
W76-13187 5E

LEAD
Geochemical Controls on Lead Concentrations in Stream Water and Sediments,
W76-12800 5A

Concentrations of Mercury, Cadmium, Lead and Copper in the Surrounding Seawater and in Seaweeds, Undaria Pinnatifida and Sargassum Fulvellum, from Suyeong Bay in Pusan, (In Korean),
W76-13190 5A

LEAF WATER POTENTIAL
Leaf Water Potential and Moisture Balance--Field Data,
W76-13011 2I

LEECHES (FEEDING BEHAVIOR)
Experiments and Observations on the Feeding Behavior of the Freshwater Leech Erpobdella Octoculata (L.) (Hirudinea: Erpobdellidae),
W76-12729 5C

LEGAL ASPECTS
Legal Aspects of Public Access to Beaches,
W76-13104 6E

Freeing the Beaches: Is It Possible,
W76-13106 6E

LEGISLATION
What Do We Do About the Water Pollution Control Act,
W76-13037 5G

LEIOSTOMUS XANTHURUS
The Response of Larval Fish, Leiostomus Xanthurus, to Environmental Stress Following Sublethal Cadmium Exposure,
W76-12732 5C

LELYSTAD (THE NETHERLANDS)
Data Analysis and System Modelling in Urban Catchment Areas (In the New Town of Lelystad, The Netherlands),
W76-12981 2A

LETHAL LIMIT
The Response of Larval Fish, Leiostom Xanthurus, to Environmental Stress Follow Sublethal Cadmium Exposure,
W76-12732

LIFE CYCLES
Metabolic Studies on the Amphipod Anisoga marus Pugettensis in Relation to its Trop Position in the Food Web of Young Salmoni
W76-12763

LIGHT INTENSITY
Environmental and Cultural Precondition Effects on the Water use Rate of Agrostis lustris Huds., Cultivar Penncross,
W76-12723

Effect of Environmental Factors Photosynthesis Patterns in Phaeodactyl Tricornutum (Bacillariophyceae). I. Effect Nitrogen Deficiency and Light Intensity,
W76-12942

LIME
Calcium Hydroxide (Lime) and the Elimina of Human Pathogenic Viruses from Sew Studies with Experimentally Contamina (Poliovirus Type 1, Sabin) and Pilot Plant S ples,
W76-12931

LIMITING FACTORS
Light/Dark-Phased Cell Division in Eugl Gracilis (Z) (Euglenophyceae) in PO4-Lim Continuous Culture,
W76-13117

LIMNOLOGY
Map Showing Lakes in the Greater Den Area Front Range Urban Corridor, Colorad
W76-12795

LINEAR PROGRAMMING
The Use of Linear Programming Techni for Estimating the Benefits from Increased curacy of Water Supply Systems,
W76-13169

LIQUEFACTION
Pore-Water Pressure Changes During Liquifaction,
W76-13171

LIQUID WATER CONTENT
Comparison Study of Models used to Pres Hydrometeor Water Content Values, Pa Preliminary Results,
W76-13172

LITERATIVE REVIEWS
Disinfection, (Literature Review),
W76-12924

LITERATURE REVIEW
Solid Wastes and Water Quality, (Litera Review),
W76-12933

LITERATURE REVIEWS
Land Application of Wastewater, (Litera Review),
W76-12676

Water Reclamation and Reuse, (Litera Review),
W76-12677

Microbiology - Detection, Occurrence, Removal of Viruses, (Literature Review),
W76-12896

Instrumentation and Automation of Wastewater Collection and Treatment Systems, (Literature Review),
W76-12901 5D

Continuous Monitoring, Automated Analysis, and Sampling Procedures, (Literature Review),
W76-12902 5A

Detergents, (Literature Review),
W76-12925 5C

Administration - Systems Analysis, (Literature Review),
W76-12926 5G

VEBEARERS
Effect of Water Temperature on the Predatory Efficiency of Gambusia Affinis,
W76-12709 5C

AM
Chemical and Plant Extractability of Metals and Plant Growth on Soils Amended with Sludge,
W76-12929 5B

BSTERS
ehavior of Lobsters (Homarus Americanus) in Semi-Natural Environment at Ambient Temeratures and Under Thermal Stress,
/76-12761 5C

GGING (RECORDING)
Vell Cuttings Analysis in Ground-Water esources Evaluation,
/76-13036 8G

NG ISLAND (NY)
Ieadow/Marsh Systems as Sewage Treatment ants,
/76-12753 5D

actors Affecting Declining Water Levels in a ewered Area of Nassau County, New York,
/76-13084 5B

NG ISLAND SOUND (NY)
sh Investigations in Long Island Sound at a uclear Power Station Site at Shoreham, New ork,
76-12743 2L

ISIANA
ffects of 1973 River Flood Waters on Brown rimp in Louisiana Estuaries,
76-12693 5C

V FLOW
chnical Manual for Estimating Low-Flow equency Characteristics of Streams in the squehanna River Basin,
76-13086 4A

NEA PEREGRA
fects of Acclimatization and Physiological te on the Tolerance to High Temperatures d Reactions to Desiccation of Theodoxus viatilis and Lymnea Peregra,
76-12741 5C

METER
dies on the Potential Evaporation of Lawns der Different Conditions of Underground ter: A Comparison of Calculated Values h the Values of a Lysimeter, (In German),
6-12757 2D

S RIVER
e Occurrence of Organic Micropollutants in River Rhine and the River Maas in 1974,
6-12988 5A

MACHIAS BAY (MAINE)
A Preliminary Assessment of the Environmental Vulnerability of Machias Bay, Maine to Oil Supertankers,
W76-13087 6G

MACROBRACHIUM-ACANTHURUS
Some Current Directed Movements of Macrobrachium Acanthurus (Wiegmann 1836) (Decapoda, Palaemonidae) under Laboratory Conditions,
W76-12707 2L

MACROPHYTES
Content of Some Trace Elements in Macrophytes of the Volga Delta, (In Russian),
W76-13194 5A

MAGNETIC STUDIES
Groundwater Geophysics in South Africa,
W76-13027 4B

MAINE
Distribution of Pelagic Fishes in the Sheepscot River-Back River Estuary, Wiscasset, Maine,
W76-12710 2L

Flood Hazard Analyses: Royal River and Chandler Brook, Town of North Yarmouth, Maine.
W76-13053 4A

A Preliminary Assessment of the Environmental Vulnerability of Machias Bay, Maine to Oil Supertankers,
W76-13087 6G

MAINTENANCE
Drainage Maintenance Programs in Ohio Counties,
W76-13009 4A

MAINTENANCE COSTS
Drainage Maintenance Programs in Ohio Counties,
W76-13009 4A

MANAGEMENT
Water Pollution, EESG Bibliography Series: 17,

ference Schemes Used to Solve Kinem
Wave Equations,
W76-12834

Methodology for the Selection and Applica
of Probability Models for the Simulation
Daily Rainfall and Runoff,
W76-12994

A Proposed Methodology for Assessing Alternative Technologies,
W76-13049 6G

MEXICO
The Role of Desalting and Brackish Water Resources in the Arid Regions of the Americas,
W76-13133 3A

MICHIGAN
Early Survival and Recruitment of Smallmouth Bass in Northern Michigan,
W76-12720 5C

Great Lakes Research Division, Chronology of Research: 1950 to the Present.
W76-12815 2H

The Nutrient Composition, Dynamics, and Ecological Significance of Drift Material in the Red Cedar River,
W76-12946 5C

MICROBIAL DEGRADATION
Feasibility of Microbial Decomposition of Organic Wastes Under Conditions in Deep Wells,
W76-12688 5D

MICROBIOLOGY
Microbiology - Detection, Occurrence, and Removal of Viruses, (Literature Review),
W76-12896 5A

Effects of Chemical Pollutants on Telemediators Intervening in the Microbiological and Planktonic Ecology in a Marine Environment: III, (In French),
W76-12922 5C

MICROORGANISMS
Effect of the Operating Conditions of Recycling Water Supply Systems on the Quality of Reused Waste Waters, (In Russian),
W76-12907 5C

MICROWAVES
Results of Soil Moisture Flights During April 1974,
W76-13178 2G

MID-ATLANTIC OCEAN
Energy Development: The Environmental Tradeoffs. Volume 3: Relative Environmental Ranking of Proposed Offshore Continental Shelf Areas on the Basis of Impacts of Oil Spills,
W76-13039 6G

MIDDLE ATLANTIC BIGHT
Environmental Survey of Two Interim Dumpsites--Middle Atlantic Bight.
W76-12875 5B

A Volumetric Temperature/Salinity Census for the Middle Atlantic Bight,
W76-12990 2L

MIDDLE CONNECTICUT RIVER BASIN (NH)
Availability of Ground Water in the Middle Connecticut River Basin, West-Central New Hampshire,
W76-13062 7C

MILLET
Tillage, Matric Potential, Oxygen and Millet Yield Relationships in a Layered Soil,
W76-13022 3F

MINE DRAINAGE
Tioga River Mine Drainage Abatement Project,
W76-12874 5G

MINE WASTES
Sublacustrine Fan Morphology in Lake Superior,
W76-13079 5B

MINERAL INDUSTRY
Map of Rock Types in Bedrock of Allegheny County, Pennsylvania,
W76-12791 7C

MINERALIZATION
Model for Predicting Simultaneous Movement of Nitrate and Water Through a Loamy Sand,
W76-12985 5B

MINING
Tioga River Mine Drainage Abatement Project,
W76-12874 5G

MINNESOTA
Chemical Waste Land Disposal Facility Demonstration Grant Application.
W76-12699 5D

Tertiary Treatment for Phosphorus Removal at Ely, Minnesota Awt Plant, April, 1973 thru March, 1974.
W76-12863 5D

Digital Models of a Glacial Outwash Aquifer in the Pearl-Sallie Lakes Area, West-Central Minnesota,
W76-13082 2F

MISSISSIPPI
The Blue Crab Fishery in Mississippi,
W76-12749 2L

Water for Industrial and Agricultural Development in Coahoma, De Soto, Panola, Quitman, Tate, and Tunica Counties, Mississippi,
W76-12798 3E

Efficiency of Nitrogen, Carbon, and Phosphorus Retention by Small Agricultural Reservoirs,
W76-12983 4D

MISSISSIPPI RIVER
Surface Water Supply of the United States, 1966-70: Part 5. Hudson Bay and Upper Mississippi River Basins--Volume 2. Upper Mississippi River Basin Above Keokuk, Iowa.
W76-13076 7C

MISSOURI
Ground-Water Quality Variation in Phelps County, Missouri,
W76-12991 5B

MIXING
Experimental Study of Turbulent Stratified Shearing Flow,
W76-12841 2L

Entrainment and Drag Forces of Deflected Jets,
W76-12969 8B

MODEL STUDIES
A Non-Linear Programming Model for Evaluating Water Supply Policies in the Texas Coastal Zone,
W76-12680 6D

Thermal Response of Heated Streams, Solution by the Implicit Method,
W76-12685 5B

An Evaluation of Two Hydrograph Separation Methods of Potential Use in Regional Water Quality Assessment,
W76-12691 5G

Studies of Columbia River Water Quality Development of Mathematical Models for Sediment and Radionuclide Transport Analysis,
W76-12702 5B

Selected Effects of Suburban Development on Runoff in South-Coastal, California.
W76-12810 4C

The Simplified Integral Mathematical Model on a Small Low-Land Catchment,
W76-12831 2A

Comparison of Required Reservoir Storages Computed by the Thomas-Fiering Model and the 'Karlsruhe Model' Type A and B,
W76-12832 4A

Chemical Dynamics of a Polluted Watershed, the Merrimack River in Northern New England,
W76-12833 5B

Wetting Front Pressure Head in the Infiltration Model of Green and Ampt,
W76-12839 2G

Major Junction Structure Verified by Modeling,
W76-12840 8B

Analysis of Multiple Cell Mechanical Draft Cooling Towers,
W76-12848 5C

Effect of Meteorological Variables on Temperature Changes in Flowing Streams,
W76-12849 5C

Modeling Residual Chlorine Levels: Closed Cycle Cooling Systems,
W76-12893 5C

A Kinetic Model for Predicting the Composition of Chlorinated Water Discharged from Power Plant Cooling Systems,
W76-12894 5C

Assessing Toxic Effects of Chlorinated Effluents on Aquatic Organisms: A Predictive Tool,
W76-12895 5C

Data Analysis and System Modelling in Urban Catchment Areas (In the New Town of Lelystad, The Netherlands),
W76-12981 2A

Methodology for the Selection and Application of Probability Models for the Simulation of Daily Rainfall and Runoff,
W76-12994 7A

Soil Moisture Regime with Subirrigation,
W76-13023 2G

Stress Concentration in Sloping Snowpack from Geometric Imperfections,
W76-13061 2C

Water Quality Model of a Salt-Wedge Estuary,
W76-13063 5B

Compiling Bathymetry for Flow Simulation Models,
W76-13064 7C

Digital Models of a Glacial Outwash Aquifer in the Pearl-Sallie Lakes Area, West-Central Minnesota,
W76-13082 2F

MODEL STUDIES

Comparison Study of Models used to Prescribe Hydrometeor Water Content Values, Part I: Preliminary Results,
W76-13172 2B

Techniques in Evaluating Suitability of Borrow Material for Beach Nourishment,
W76-13175 8B

Stochastic Sea State for SRB Studies,
W76-13177 2L

Studies on Numerical Modeling and Modification of Cyclone Scale Precipitation,
W76-13185 3B

MOIST HEAT METHOD

Studies on the Interactions Between Soil Water and Thinly Dispersed Solid Matter Using the Moist Heat Method, (In Romanian),
W76-12706 2G

MOISTURE

Continuing Measurements of a Swelling Clay in a Ponded Cut,
W76-12818 8D

MOISTURE CONTENT

Pore Volume Distribution and Curve of Water Content Versus Suction of Porous Body: 1. Two Boundary Drying Curves,
W76-12984 2G

MOLLUSKS

Mechanism of Death at High Temperatures in Helix and Patella,
W76-12746 5C

MONITORING

Survey for Radioactivity in a Swamp,
W76-12689 5C

Study of Federal Water Quality Monitoring Efficiency,
W76-12697 5G

NASA To Test New Techniques For On-Stream Water Monitoring,
W76-12900 5A

Continuous Monitoring, Automated Analysis, and Sampling Procedures, (Literature Review),
W76-12902 5A

Samplers for Monitoring Runoff Waters,
W76-13006 5A

Shipboard Oil-in-Water Content Monitor Based on Small Angle Forward Light Scattering,
W76-13094 5G

Irrigation System Controller,
W76-13137 3F

Method and Device for Ascertaining Small Amounts of Oil in Water,
W76-13156 5A

MONTANA

Hydrologic Unit Map--1974, State of Montana,
W76-12793 7C

MORTALITY

Early Survival and Recruitment of Smallmouth Bass in Northern Michigan,
W76-12720 5C

Mortality of the Early Developmental Stages of the Roach- Rutilus Rutilus (Linnaeus, 1758),
W76-12721 5C

Some Effects of Temperature, Chlorine and Copper on the Survival and Growth of the Coon Stripe Shrimp, Pandalus Danae,
W76-12722 5C

Growth and Mortality of Two Groups of Oysters, (Crassostrea Virginica Gmelin), Maintained in Cooling Water at an Estuarine Electric Power Generating Station,
W76-12726 5C

The Response of Larval Fish, Leiostomus Xanthurus, to Environmental Stress Following Sublethal Cadmium Exposure,
W76-12732 5C

Mechanism of Death at High Temperatures in Helix and Patella,
W76-12746 5C

Physiological Changes During the Course of Blooms of Aphanizomenon Flos-Aquae,
W76-13114 5C

MORUYA RIVER (AUSTRALIA)

The Ecology of Algae in the Moruya River, Australia,
W76-12934 5C

MOSSES

Effect of Suspended Coal Particles on Life Forms of Aquatic Moss Eurhynchium Riparioides (HEDW): II. The Effect on Spore Germination and Regeneration of Apical Tips,
W76-12913 5C

MUNICIPAL WATER

A Non-Linear Programming Model for Evaluating Water Supply Policies in the Texas Coastal Zone,
W76-12680 6D

A Virus-In-Water Study of Finished Water From Six Communities,
W76-12866 5A

MURES RIVER

A Mathematical Model for Flood-Wave Forecasting by Means of Warning Basins,
W76-12829 4A

MUTAGENESIS

The Potential for Increased Mutagenic Risk to the Human Population Due to the Products of Water Chlorination,
W76-12887 5C

N-NITROSO DIMETHYL AMINE

The Evaporation and Degradation of N-Nitroso Dimethyl Amine in Aqueous Solutions,
W76-12852 5B

NA/K RATIO

Mechanism of Death at High Temperatures in Helix and Patella,
W76-12746 5C

NANTUCKET SHOALS

A Volumetric Temperature/Salinity Census for the Middle Atlantic Bight,
W76-12990 2L

NARRAGANSETT BAY (RI)

The Potential Effects of Increasing Oil Tanker Size on Narragansett Bay. An Advisory Report to the Coastal Resources Management Council,
W76-13088 6G

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Operation and Impact of NPDES in Region II, Part 2,
W76-13059 5G

NATURAL RESOURCES

The Social and Economic Importance of th Caroni Swamp in Trinidad and Tabago,
W76-12952 6

Conservation: EESG Bibliography Series:16,
W76-12953 6

NAVIGATION

Benefits of an Extended Season: The E periences of One Industrial User,
W76-12956 6

NEARSHORE MORPHOLOGY

Beach Dynamics and Nearshore Morphology the Beaufort Sea Coast, Alaska,
W76-12820 2

NEOMYSIS-MIRABILIS

Comparative Estimation of the Role of Detrit and Algae in Neomysis Mirabilis (Czerniavsk Nutrition, (In Russian),
W76-13149

NERITIC ZONE

An Estimation of Total Production of Plan tonic Copepods in Neritic Zone of the Gol Dulion (Banyuls-Sur-Mer): I. Quantitative A nual Variation, (In French),
W76-12954 5

NEUTRON ACTIVATION ANALYSIS

Thermal Effects on the Accumulation of A senic in Green Sunfish, Lepomis Cyanellus,
W76-12731 5

NEVADA

A Brief Hydrologic Appraisal of the July 3- 1975, Flash Flood in Las Vegas Valle Nevada,
W76-12806 4

A Summary of the Ground-Water Hydrology the Area Between the Las Vegas Valley a the Amargosa Desert, Nevada, With Speci Reference to the Effects of Possible Ne Withdrawals of Ground Water,
W76-12807 4

Estimating Peak Discharges from Sm Drainages in Nevada According to Basin Are Within Elevation Zones,
W76-13080 4

NEVADA TEST SITE (NEV)

A Summary of the Ground-Water Hydrology the Area Between the Las Vegas Valley a the Amargosa Desert, Nevada, With Speci Reference to the Effects of Possible Ne Withdrawals of Ground Water,
W76-12807 4

NEW ENGLAND

Chemical Dynamics of a Polluted Watershe the Merrimack River in Northern New E gland,
W76-12833 5

NEW HAMPSHIRE

Availability of Ground Water in the Midd Connecticut River Basin, West-Central Ne Hampshire,
W76-13062 7

NEW MEXICO

An Overview of the Precipitation Processi System at the Southwest Watershed Researc Center,
W76-13132 7

NEW RIVER (VA)
Summer Distribution of Fish Species in the Vicinity of a Thermal Discharge New River, Virginia,
W76-12717 5C

NEW YORK
A Survey of New York Surface Water Temperatures. Aerial Infrared Surveys of Thermal Discharges from Electric Generating Stations into New York State Waters.
W76-12698 5B

Lake George Site Synthesis, 1974-1975.
W76-12937 5C

Factors Affecting Declining Water Levels in a Sewered Area of Nassau County, New York,
W76-13084 5B

Possible Effect of Lower Phosphorus Concentrations on the Phytoplankton in Onondaga Lake, New York, U.S.A.,
W76-13116 5C

Seasonal Variations in the Purification of Treatment Plant Effluent in Natural Sand Deposits,
W76-13121 5D

NEW YORK BIGHT
Possible Effects of Construction and Operation of a Supertanker Terminal on the Marine Environment in the New York Bight,
W76-13089 6G

NITRATE LOSSES
Losses of Nitrogen in Surface Runoff in the Blackland Prairie of Texas,
W76-12982 5G

NITRATE REDUCTASE
An Automated Assay for the Determination of Nitrate Reductase in Marine Phytoplankton,
W76-12940 5C

NITRATES
Significance of Cellular Nitrate Content in Natural Populations of Marine Phytoplankton Growing in Shipboard Cultures,
W76-12936 5C

Model for Predicting Simultaneous Movement of Nitrate and Water Through a Loamy Sand,
W76-12985 5B

Ground-Water Quality Variation in Phelps County, Missouri,
W76-12991 5B

NITRIFICATION
Ammonia Removal from Wastewaters: A Review of the State of the Art,
W76-12853 5D

NITROGEN
Environmental and Cultural Preconditioning Effects on the Water use Rate of Agrostis Palustris Huds., Cultivar Penncross,
W76-12723 2I

The Vegetation of Dune Slacks at Newborough Warren: III. Plantago Coronopus,
W76-12911 3C

Effect of Environmental Factors on Photosynthesis Patterns in Phaeodactylum Tricornutum (Bacillariophyceae). I. Effect of Nitrogen Deficiency and Light Intensity,
W76-12942 5C

Studies on a Purified Diet of Prawn: IV. Evaluation of Protein, Free Amino Acids and Their Mixture as Nitrogen Source, (In Japanese),
W76-12992 5C

Factors Influencing the Loss of Nitrogen and Phosphorus from a Tract of Irrigated Land,
W76-13014 5G

Drought Resistance of Blue Grama as Affected by Atrazine and N. Fertilizer,
W76-13122 2I

Range Fertilization in the Northern Great Plains,
W76-13131 4A

NITROGEN COMPOUNDS
Losses of Nitrogen in Surface Runoff in the Blackland Prairie of Texas,
W76-12982 5G

Efficiency of Nitrogen, Carbon, and Phosphorus Retention by Small Agricultural Reservoirs,
W76-12983 4D

NITROGEN FIXATION
Regulation of Nitrate Assimilation by Amino Acids in Chlorella,
W76-13119 5C

NITROGEN LOSSES
Losses of Nitrogen in Surface Runoff in the Blackland Prairie of Texas,
W76-12982 5G

NITROGEN RETENTION
Efficiency of Nitrogen, Carbon, and Phosphorus Retention by Small Agricultural Reservoirs,
W76-12983 4D

NON-CEASING SCOUR
Erosion and Transport of Bed-Load Sediment,
W76-12827 2J

NORTH CAROLINA
Atmospheric Input of Some Cations and Anions to Forest Ecosystems in North Carolina and Tennessee,
W76-12838 2K

North Carolina Marine Algae. VI. Some Ceramiales (Rhodophyta), Including a New Species of Dipterosiphonia,
W76-13025 5C

Water Resources Data for North Carolina, Water Year 1975.
W76-13067 7C

Thermal Loading of Hyco Lake, North Carolina-- the Effect of Heated Water on Temperature and Evaporation, 1966-74,
W76-13078 5C

An ERTS-1 Study of Coastal Features on the North Carolina Coast,
W76-13174 7B

NORTH DAKOTA
Ground-Water Basic Data for Dunn County, North Dakota.
W76-12786 7C

Studies on Helminths of North Dakota: V. Life History of Phyllodistomum Nocomis Fischthal, 1942 (Trematoda:Gorgoderidae),
W76-12912 2I

NORTH YARMOUTH (ME)
Flood Hazard Analyses: Royal River and Chandler Brook, Town of North Yarmouth, Maine.
W76-13053 4A

NUCLEAR POWERPLANTS
An Assessment of Nuclear Power Plant Waste Heat Utilization for Freshwater Fish Farming,
W76-12682 5C

Fish Investigations in Long Island Sound at a Nuclear Power Station Site at Shoreham, New York,
W76-12743 2L

NUCLEAR WASTES
Correlation of Radioactive Waste Treatment Costs and the Environmental Impact of Waste Effluents in the Nuclear Fuel Cycle for Use in Establishing as Low as Practicable Guides-Fabrication of Light-Water Reactor Fuels Containing Plutonium,
W76-12694 5C

Acid Digestion of Combustible Wastes: A Status Report,
W76-12776 5D

NUCLEATION
Population Balance Use in Dilute Impurity Problems,
W76-12914 5B

NUISANCE ALGAE
Physiological Changes During the Course of Blooms of Aphanizomenon Flos-Aquae,
W76-13114 5C

NUMERICAL ANALYSIS
A Note on the Step Error of Some Finite-Difference Schemes Used to Solve Kinematic Wave Equations,
W76-12834 2E

Finite-Difference Model for Aquifer Simulation in Two Dimensions with Results of Numerical Experiments,
W76-13085 2F

NUTRIENT REMOVAL
Losses of Nitrogen in Surface Runoff in the Blackland Prairie of Texas,
W76-12982 5G

NUTRIENT REQUIREMENTS
Field Determination of the Critical Nutrient Concentrations for Cladophora in Streams,
W76-13120 5C

Combined Irrigation and Fertilization of Tomatoes Grown on Sand Dunes,
W76-13127 3C

Genotype Variation in Nutrient Uptake Efficiency in Corn,
W76-13134 3F

NUTRIENT UPTAKE (CORN)
Genotype Variation in Nutrient Uptake Efficiency in Corn,
W76-13134 3F

NUTRIENTS
Apollo County Park Wastewater Reclamation Project. Antelope Valley, California,
W76-12864 5D

The Nutrient Composition, Dynamics, and Ecological Significance of Drift Material in the Red Cedar River,
W76-12946 5C

Nutrient Losses in Surface Runoff From Winter Spread Manure,
W76-12993 5B

OBSERVATION WELLS
Fluctuations of Ground-Water Levels in Lee County, Florida, in 1974,

Onshore Impacts of Oil and Gas Development in Alaska. Volume II. Methodology Appendices.
W76-13091 5G

Shipboard Oil-in-Water Content Monitor Based on Small Angle Forward Light Scattering,
W76-13094 5G

OVERFLOW
Computer Halts Flooding Complaints,
W76-12905 5D

OVERLAND FLOW
Land Application of Wastewater, (Literature Review),
W76-12676 5D

Effects of Overbank Flow in Flood Computations,
W76-12976 2E

OVERWINTERING SITES
Occurrence, Viability and Significance of Resting Eggs of the Calanoid Copepod Labidocera Aestiva,
W76-12737 6G

The Blue Crab Fishery in Mississippi,
W76-12749 2L

OXIDATION
Oxidation Process for Improving the Environmental Quality of Water Containing Sulfur and/or Inorganic Sub-Six-Sulfur-Containing Impurities,
W76-13150 5D

OXIDATION LAGOONS
How To Design Aerated Lagoon Systems to Meet 1977 Effluent Standards - Evaluation of Kinetic Coefficients,
W76-12903 5D

OXYGEN
Tillage, Matric Potential, Oxygen and Millet Yield Relationships in a Layered Soil,
W76-13022 3F

OYSTERS
Growth and Mortality of Two Groups of Oysters, (Crassostrea Virginica Gmelin), Maintained in Cooling Water at an Estuarine Electric Power Generating Station,
W76-12726 5C

PACIFIC COAST REGION
Surface Water Temperatures at Shore Stations, United States West Coast, 1973.
W76-12995 7C

PACKED HOLE THEORY
How to Drill a Usable Hole - Part 2, Designing the Bottomhole Assembly,
W76-13038 8B

PALOUSE RIVER BASIN AREA (WASH-IDA-ORE)
Variation of Suspended Sediment Load in the Palouse Region of the Northwest,
W76-13012 5G

PARASITES
Studies on Helminths of North Dakota: V. Life History of Phyllodistomum Nocomis Fischthal, 1942 (Trematoda:Gorgoderidae),
W76-12912 2I

PARASITISM
Relation of Water Temperature to Ceratomyxosis in Rainbow Trout (Salmo Gairdneri) and Coho Salmon (Oncorhynchus Kisutch),
W76-12716 5C

PARTIAL PENETRATION
Analysis of Aquifer-Aquitard Flow,
W76-12836 2F

PARTICLE SIZE
Population Balance Use in Dilute Impurity Problems,
W76-12914 5B

Physical-Chemical Composition of Eroded Soil,
W76-13010 2J

PATELLA
Mechanism of Death at High Temperatures in Helix and Patella,
W76-12746 5C

PATENTS
Sea Water Desalination Apparatus,
W76-13136 3A

Irrigation System Controller,
W76-13137 3F

Water Action Powered Pump,
W76-13138 8C

Geothermal Energy System Heat Exchanger and Control Apparatus,
W76-13139 4B

Method and Apparatus for Treating Liquid Contaminated with Radioactive Particulate Solids,
W76-13142 5D

Sodium Sulfur Oxides Wastes Disposal Process,
W76-13143 5D

Apparatus and Method for Protecting a Shoreline Against Contamination from an Oil Spill,
W76-13144 5G

Rain Storing Tank,
W76-13145 5D

Immersion Filter,
W76-13146 5D

Apparatus for Softening Hard Water,
W76-13147 5F

Separator,
W76-13148 5F

Oxidation Process for Improving the Environmental Quality of Water Containing Sulfur and/or Inorganic Sub-Six-Sulfur-Containing Impurities,
W76-13150 5D

System of Water Purification and Product Distribution,
W76-13151 5F

Retrieval Means for a Floating Liquid Spilling,
W76-13152 5G

Novel Polymer Membranes for Reverse Osmosis,
W76-13153 5F

Apparatus for the Prevention of Scaling in Desalination Apparatus,
W76-13154 3A

Method of Removing Material from a Bed of a Body of Water,
W76-13155 5G

Method and Device for Ascertaining Small Amounts of Oil in Water,
W76-13156 5A

Lawn Sprinkling and Similar Installations,
W76-13157 3F

Lawn, Farm, and Orchard Sprinklers,
W76-13158 3F

Method and Apparatus for Precipitating Colloids from Aqueous Suspensions,
W76-13159 5D

Determination of Sodium Form Water Softener Breakthrough,
W76-13161 5F

PATH OF POLLUTANTS

Thermal Response of Heated Streams, Solution by the Implicit Method,
W76-12685 5B

A Survey of New York Surface Water Temperatures. Aerial Infrared Surveys of Thermal Discharges from Electric Generating Stations into New York State Waters.
W76-12698 5B

Preliminary Evaluation of the Radiological Quality of the Water on Bikini and Eneu Islands,
W76-12701 5C

Studies of Columbia River Water Quality Development of Mathematical Models for Sediment and Radionuclide Transport Analysis,
W76-12702 5B

Savannah River Laboratory Environmental Transport and Effects Research, Annual Report - FY 1975,
W76-12714 5B

Measurements of Physical Phenomena Related to Power Plant Waste Heat Discharges: Lake Michigan, 1973 and 1974,
W76-12770 5B

Measurements of Eddy Diffusivities in Nearshore Regions of Lake Michigan,
W76-12772 5B

An Analytical Method for Determining Heat Transfer from Power Plant Coolant in the Florida Boulder Zone,
W76-12777 5B

Geochemical Controls on Lead Concentrations in Stream Water and Sediments,
W76-12800 5A

Experimental Study of Turbulent Stratified Shearing Flow,
W76-12841 2L

Transient Dispersion in Uniform Porous Media Flow,
W76-12842 5B

Fate of Metals in Wastewater Discharge to Ocean,
W76-12927 5B

Water Quality Model of a Salt-Wedge Estuary,
W76-13063 5B

Epifauna at Jackson Point in Port Valdez, Alaska, December 1970 through September 1972,
W76-13070 5A

Sublacustrine Fan Morphology in Lake Superior,
W76-13079 5B

Inputs of Phosphorus from Precipitation to Lake Michigan,
W76-13112 5B

PATHOGENIC BACTERIA

Effect of the Operating Conditions of Recycling Water Supply Systems on the Quality of Reused Waste Waters, (In Russian),
W76-12907 5C

PEAK DISCHARGE

The Impact of Suburbanization on the Stream Channel Networks of Ralston Creek and South Branch, Iowa,
W76-13051 4C

Estimating Peak Discharges from Small Drainages in Nevada According to Basin Areas Within Elevation Zones,
W76-13080 4A

PEAK DISCHARGES

Urban Hydrology for Small Watersheds.
W76-13044 4C

PEARL-SALLIE LAKES AREA (MINN)

Digital Models of a Glacial Outwash Aquifer in the Pearl-Sallie Lakes Area, West-Central Minnesota,
W76-13082 2F

PELAGIC FISHES

Distribution of Pelagic Fishes in the Sheepscot River-Back River Estuary, Wiscasset, Maine,
W76-12710 2L

PENNSYLVANIA

Map of Rock Types in Bedrock of Allegheny County, Pennsylvania,
W76-12791 7C

Tioga River Mine Drainage Abatement Project,
W76-12874 5G

Preimpoundment Water Quality of Raystow Branch Juniata River and Six Tributa Streams, South-Central Pennsylvania,
W76-13065

Interdisciplinary Applications and Interpre tion of EREP Data Within the Susquehan River Basin,
W76-13188

PERCEPTION THRESHOLD CONCENTRATIONS

Characteristics of the Toxic Effect Propylphenol Isomers and their Safe Level Water Bodies, (In Russian),
W76-12850

PERCOLATING WATER

Sprinkler Irrigation Percolation Losses,
W76-13005

PERCOLATION

Sprinkler Irrigation Percolation Losses,
W76-13005

PERIDINIUM TROCHOIDEUM

Effects of Chemical Pollutants on Telemed tors Intervening in the Microbiological a Planktonic Ecology in a Marine Environme III, (In French),
W76-12922

PERIPHYTON

Periphyton Crops and Productivity in a Reac Thermal Effluent,
W76-12762

Ultrasonic Removal of Epilithic Algae in a B clamp Sampler,
W76-12939

PERMEABILITY

Ground Water Movement,
W76-13031

PERMITS

Operation and Impact of NPDES in Region Part 2,
W76-13059

PERTURBATION ANALYSIS

Onset of Thermohaline Convection in a Cav nous Aquifer,
W76-12835

PESTICIDES

Toxicity of Natural Pyrethrins and F Pyrethroids to Fish,
W76-12742

The Occurrence of Organic Micropollutants the River Rhine and the River Maas in 1974,
W76-12988

PETROLEUM YEASTS

Utilization of Petroleum Yeast in Fish Feed: Effect on Growth and Body Lipids of Rainb Trout Fingerlings Raised in Cages, Japanese),
W76-12960

PHAEODACTYLUM TRICORNUTUM

Effect of Environmental Factors Photosynthesis Patterns in Phaeodactyl Tricornutum (Bacillariophyceae). I. Effect Nitrogen Deficiency and Light Intensity,
W76-12942

PHELPS COUNTY (MO)

Ground-Water Quality Variation in Phe County, Missouri,
W76-12991

NOLS
haracteristics of the Toxic Effect of opylphenol Isomers and their Safe Level in ater Bodies, (In Russian),
76-12850 5C

LIPPINES
fects of Overbank Flow in Flood Computa-ns,
76-12976 2E

SPHORUS
rtiary Treatment for Phosphorus Removal at , Minnesota Awt Plant, April, 1973 thru rch, 1974.
76-12863 5D

proved Liquid-Solids Separation by an Alu-num Compound in Activated Sludge Treat-nt,
76-12867 5D

e Vegetation of Dune Slacks at Newborough rren: III. Plantago Coronopus,
76-12911 3C

osphorus Reduction with Bivalent Iron fate at the Kappala Water Purification nt, (In Swedish)
76-12989 5D

ctors Influencing the Loss of Nitrogen and osphorus from a Tract of Irrigated Land,
76-13014 5G

uts of Phosphorus from Precipitation to ke Michigan,
76-13112 5B

ssible Effect of Lower Phosphorus Concen-ions on the Phytoplankton in Onondaga ke, New York, U.S.A.,
76-13116 5C

SPHORUS COMPOUNDS
iciency of Nitrogen, Carbon, and osphorus Retention by Small Agricultural ervoirs,
76-12983 4D

SPHORUS LOAD
ld Determination of the Critical Nutrient ncentrations for Cladophora in Streams,
76-13120 5C

PHORUS RETENTION
iciency of Nitrogen, Carbon, and sphorus Retention by Small Agricultural ervoirs,
76-12983 4D

TOCHEMICAL ACTIVITY
nges in the Reactivity of the Photosynthetic paratus in Heterotrophic Ageing Cultures of nedesmus Obliquus. I. Changes in the tochemical Activities,
76-13109 5C

OINTERPRETATION
sification and Analysis of River Processes,
76-12973 8B

OSYNTHESIS
ct of Environmental Factors on tosynthesis Patterns in Phaeodactylum ornutum (Bacillariophyceae). I. Effect of ogen Deficiency and Light Intensity,
76-12942 5C

nges in the Reactivity of the Photosynthetic aratus in Heterotrophic Ageing Cultures of Scenedesmus Obliquus. I. Changes in the Photochemical Activities,
W76-13109 5C

Changes in the Reactivity of the Photosynthetic Apparatus in Heterotrophic Ageing Cultures of Scenedesmus Obliquus. II. Changes in Ultrastructure and Pigment Composition,
W76-13110 5C

Changes in the Reactivity of the Photosynthetic Apparatus in Heterotrophic Ageing Cultures of Scenedesmus Obliquus. III. Recovery of the Photosynthetic Capacity in Aged Cells,
W76-13111 5C

PHREATOPHYTES
Quantitative Relationship Between Reflectance and Transpiration of Phreatophytes--Gila River Test Site,
W76-12802 2D

PHYSICAL PROPERTIES
Water Quality Investigations in a Small Artificial Reservoir,
W76-12943 5C

PHYSIOLOGICAL ECOLOGY
Some Physiological Effects of Near-Maximum Growth Temperatures on an Obligately Psycrophilic Marine Bacterium,
W76-12681 5C

Physiological Ecology of Four Polysiphonia Species (Rhodophyta, Ceramiales),
W76-12705 5C

PHYTOPLANKON
Possible Effect of Lower Phosphorus Concentrations on the Phytoplankton in Onondaga Lake, New York, U.S.A.,
W76-13116 5C

PHYTOPLANKTON
Warm Water Effluents and Plankton, (In Japanese),
W76-12740 5C

Phytoplankton Generic Diversity and Biomass Estimates of a Monogahela River Acid Confluence,
W76-12748 5C

Fluctuations of Phytoplankton Biomass and its Composition in a Subarctic Lake During Summer,
W76-12938 5C

PIGMENTS
Changes in the Reactivity of the Photosynthetic Apparatus in Heterotophic Ageing Cultures of Scenedesmus Obliquus. II. Changes in Ultrastructure and Pigment Composition,
W76-13110 5C

PIPE FLOW
Comparison of Single-Point Injections in Pipe Flow,
W76-12971 8B

PITTING (CORROSION)
Semiarid Rangeland Treatment and Surface Runoff,
W76-13130 4A

PLANKTON
Effects of Chemical Pollutants on Telemediators Intervening in the Microbiological and Planktonic Ecology in a Marine Environment: III, (In French),
W76-12922 5C

An Estimation of Total Production of Planktonic Copepods in Neritic Zone of the Golfe Dulion (Banyuls-Sur-Mer): I. Quantitative Annual Variation, (In French),
W76-12954 5C

Dynamics of Number and Biomass of Planktonic Infusoria in Open Zones of Kremenchug Reservoir and Their Production and Role in Organic Matter Destruction, (In Russian),
W76-13141 2H

PLANNING
Plan of Work, Red River Basin Above Denison Dam.
W76-12816 4A

Example for Regional Planning of Water Quality in Denmark (Beispiel Einer Regionalen Planung der Gewaesserqualitaet in Daenemark),
W76-12918 5G

Administration - Systems Analysis, (Literature Review),
W76-12926 5G

Planning for Water Recreation in Israel,
W76-12959 6B

Public Participation in Water Resources Planning: An Evaluation of the Programs of 15 Corps of Engineer Districts-Summary of Evaluation and Recommendations,
W76-13041 6E

Public Participation in Water Resources Planning: An Evaluation of the Programs of 15 Corps of Engineers Districts,
W76-13042 6E

A Proposed Methodology for Assessing Alternative Technologies,
W76-13049 6G

Development of Residuals Management Strategies: An Executive Summary,
W76-13054 5G

The Development Criteria of the Preliminary Coastal Plan,
W76-13092 2L

PLANT GROWTH
Comparative Studies of Plant Growth and Distribution in Relation to Waterlogging: VII. The Influence of Water-Table Fluctuations on Iron and Manganese Availability in Dune Slack Soils,
W76-12708 2I

Finite Difference and Finite Element Simulation of Field Water Uptake by Plants,
W76-12830 2G

Chemical and Plant Extractability of Metals and Plant Growth on Soils Amended with Sludge,
W76-12929 5B

Genotype Variation in Nutrient Uptake Efficiency in Corn,
W76-13134 3F

PLANT PHYSIOLOGY
Changes in the Reactivity of the Photosynthetic Apparatus in Heterotrophic Ageing Cultures of Scenedesmus Obliquus. I. Changes in the Photochemical Activities,
W76-13109 5C

Changes in the Reactivity of the Photosynthetic Apparatus in Heterotophic Ageing Cultures of Scenedesmus Obliquus. II. Changes in Ultrastructure and Pigment Composition,
W76-13110 5C

Changes in the Reactivity of the Photosynthetic Apparatus in Heterotrophic Ageing Cultures of Scenedesmus Obliquus. III. Recovery of the Photosynthetic Capacity in Aged Cells,
W76-13111 5C

Physiological Changes During the Course of Blooms of Aphanizomenon Flos-Aquae,
W76-13114 5C

Regulation of Nitrate Assimilation by Amino Acids in Chlorella,
W76-13119 5C

PLANTAGO-CORONOPUS
The Vegetation of Dune Slacks at Newborough Warren: III. Plantago Coronopus,
W76-12911 3C

PLASTIC
Deflection-Stiffness Characteristics of Corrugated Plastic Tubing,
W76-13018 4A

PLASTIC DEFORMATION
Deflection-Stiffness Characteristics of Corrugated Plastic Tubing,
W76-13018 4A

PLASTIC PIPES
Deflection-Stiffness Characteristics of Corrugated Plastic Tubing,
W76-13018 4A

POLAND
Behavior of Cesium-137 in Soils and Soil-Plant Systems, (In Polish),

Tortuguero Bay Environmental Studies,
W76-12783 6G

PUMP TESTING
Efficiency-A World of Fantasy,
W76-13028 8G

PUMPING
Annual Summary of Ground-Water Conditions in Arizona, Spring 1974 to Spring 1975.
W76-12792 7C

PUMPS
Recommended Design of Sample Intake Systems for Automatic Instrumentation,
W76-12871 5A

Whatever Happened to the Hydraulic Ram.
W76-13034 8C

Water Action Powered Pump,
W76-13138 8C

PYRETHRINS
Toxicity of Natural Pyrethrins and Five Pyrethroids to Fish,
W76-12742 5C

PYRETHROIDS
Toxicity of Natural Pyrethrins and Five Pyrethroids to Fish,
W76-12742 5C

PYROLYSIS SYSTEM
Preliminary Assessment of Systems for Deriving Liquid and Gaseous Fuels from Waste or Grown Organics,
W76-12967 5D

QU'APPELLE RIVER BASIN (SASK)
Annual Report for the Year Ending March 31, 1975, Saskatchewan Department of the Environment.
W76-13052 6E

QUARRIES
Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Colorado Springs-Castle Rock Area, Front Range Urban Corridor, Colorado,
W76-12787 7C

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Boulder-Fort Collins-Greeley Area, Front Range Urban Corridor, Colorado,
W76-12789 7C

Map Showing Potential Sources of Gravel and Crushed-Rock Aggregate in the Greater Denver Area, Front Range Urban Corridor, Colorado,
W76-12796 7C

RADIANCE
Spectral Reflectance and Radiance Characteristics of Water Pollutants,
W76-13176 5A

RADIOACTIVE DECAY
Transient Dispersion in Uniform Porous Media Flow,
W76-12842 5B

RADIOACTIVE WASTE DISPOSAL
Atlantic Richfield Hanford Company, Quarterly Report, Technology Development for Long-Term Management of Hanford High-Level Waste, July 1975 Through September 1975.
W76-12684 5D

Interim Solidification of SRP Waste with Silica, Bentonite, or Phosphoric Acid,
W76-12690 5D

Method and Apparatus for Treating Liquid Contaminated with Radioactive Particulate Solids,
W76-13142 5D

RADIOACTIVE WASTES
Combined Effects on the Environment of Radioactive, Chemical and Thermal Releases from the Nuclear Industry, (Report on the International Symposium Held in Stockholm June 2-5, 1975),
W76-12765 5C

Method and Apparatus for Treating Liquid Contaminated with Radioactive Particulate Solids,
W76-13142 5D

RADIOACTIVITY
Survey for Radioactivity in a Swamp,
W76-12689 5C

Correlation of Radioactive Waste Treatment Costs and the Environmental Impact of Waste Effluents in the Nuclear Fuel Cycle for Use in Establishing as Low as Practicable Guides-Fabrication of Light-Water Reactor Fuels Containing Plutonium,
W76-12694 5C

Combined Effects on the Environment of Radioactive, Chemical and Thermal Releases from the Nuclear Industry, (Report on the International Symposium Held in Stockholm June 2-5, 1975),
W76-12765 5C

RADIOACTIVITY EFFECTS
Cesium 137 Activities in Fish Residing in Thermal Discharges to Lake Michigan,
W76-12738 5C

RADIOACTIVITY TECHNIQUES
Environmental Trace Materials: Computer Coupled Radioactivation Analysis,
W76-12712 5A

The Coastal Plains Regional Commission--U.S. Geological Survey. Aeromagnetic-Aeroradioactivity Survey,
W76-13099 7E

RADIOCARBON METHOD
Comparative Estimation of the Role of Detritus and Algae in Neomysis Mirabilis (Czerniavsky) Nutrition, (In Russian),
W76-13149 2

RADIOISOTOPES
Effect of the Soil Moisture Regime on the Passage of Strontium-90, Cesium-137 and Cerium-144 from Soil into Solution, (In Russian),
W76-12868 5B

LIBRARY OF THE UNIVERSITY OF ILLINOIS

The Conduct of Certain Long-Lived Isotopes in Rocks in the Case of Their Contamination with Nontechnical Effluents of the Atomic Electric Power Stations (AES), (In Russian),
W76-12908 5B

Behavior of Cesium-137 in Soils and Soil-Plant Systems, (In Polish),
W76-12909 5B

Statistical Probability Characteristics of the Accumulation of Radionuclides in Freshwater Plants, (In Russian),
W76-13189 5A

RAINBOW TROUT
Relation of Water Temperature to Ceratomyxosis in Rainbow Trout (Salmo Gairdneri) and Coho Salmon (Oncorhynchus Kisutch),
W76-12716 5C

Behavioral Thermoregulation in Hypophysectomized and Sham-Operated Rainbow Trout, Salmo Gairdneri,
W76-12755 5C

Utilization of Petroleum Yeast in Fish Feed: II. Effect on Growth and Body Lipids of Rainbow Trout Fingerlings Raised in Cages, (In Japanese),
W76-12960 2I

RAINFALL
Urban Stormwater Runoff: Determination of Volumes and Flowrates,
W76-12858 5B

A Mathematical Model of the 'Reservoir' Type Designed for Flood-Wave Modelling and Forecasting,
W76-12979 2A

Methodology for the Selection and Application of Probability Models for the Simulation of Daily Rainfall and Runoff,
W76-12994 7A

Geomorphology and Climatology of Arid Watersheds,
W76-13135 2A

Mesometeorological Studies of Precipitation,
W76-13186 2B

RAINWATER
Rain Storing Tank,
W76-13145 5D

RANGE MANAGEMENT
Plant Survival in the Arid Southwest 30 Years After Seeding,
W76-13128 4A

Semiarid Rangeland Treatment and Surface Runoff,
W76-13130 4A

Range Fertilization in the Northern Great Plains,
W76-13131 4A

RANGIA CUNEATA
Reproduction and Recruitment of the Brackish Water Clam Rangia Cuneata in the James River, Virginia,
W76-12728 5C

REAL-TIME FORECASTING
An Adaptive Identification and Prediction Algorithm for the Real-Time Forecasting of Hydrological Time Series,
W76-12980 2A

RECLAIMED WATER
Water Reclamation and Reuse, (Literature Review),
W76-12677 5D

AWT Energy Needs - A Prime Concern,
W76-12919 5D

RECLAMATION
Water Reclamation and Reuse, (Literature Review),
W76-12677 5D

AWT Energy Needs - A Prime Concern,
W76-12919 5D

RECREATION
Planning for Water Recreation in Israel,
W76-12959 6B

Impacts of Recreational Development: The Voyager Village Experience,
W76-12965 6B

Public Evaluation of Water Quality and Its Impact on Recreation: A Case from Iowa,
W76-13050 5G

RECREATION DEMAND
A Cluster Analysis of Activity, Frequency, and Environment Variables to Identify Water-Based Recreation Types,
W76-12955 6B

RECREATION TYPOLOGY
A Cluster Analysis of Activity, Frequency, and Environment Variables to Identify Water-Based Recreation Types,
W76-12955 6B

RECYCLING
Water Reclamation and Reuse, (Literature Review),
W76-12677 5D

A Technical, Environmental and Economic Evaluation of the 'Wet Processing System for the Recovery and Disposal of Municipal Solid Waste'.
W76-12854 5D

Effect of the Operating Conditions of Recycling Water Supply Systems on the Quality of Reused Waste Waters, (In Russian),
W76-12907 5C

Stimulation of Denitrification in Soil Columns by Adding Organic Carbon to Wastewater,
W76-12920 5D

The Economics of Recovery of Materials from Industrial Waste--A Case Study,
W76-12948 5D

Solid Waste: Is There a Profit Potential,
W76-12951 5D

Preliminary Assessment of Systems for Deriving Liquid and Gaseous Fuels from Waste or Grown Organics,
W76-12967 5D

RED CEDAR RIVER (MICH). *DRIFT MATERIAL (STREAMS)
The Nutrient Composition, Dynamics, and Ecological Significance of Drift Material in the Red Cedar River,
W76-12946 5C

RED RIVER BASIN (TEX-OKLA)
Plan of Work, Red River Basin Above Denison Dam.
W76-12816 4A

REDUCTION (CHEMICAL)
Effects of Chlorine and Sulfite Reduction on Lake Michigan Invertebrates,
W76-13113 5C

REEDS
Content of Some Trace Elements in Macrophytes of the Volga Delta, (In Russian),
W76-13194 5A

REFLECTANCE
Spectral Reflectance and Radiance Characteristics of Water Pollutants,
W76-13176 5A

REGENERATION
Effect of Suspended Coal Particles on Life Forms of Aquatic Moss Eurhynchium Riparioides (HEDW): II. The Effect on Spore Germination and Regeneration of Apical Tips,
W76-12913 5C

REGIONAL ANALYSIS
Example for Regional Planning of Water Quality in Denmark (Beispiel Einer Regionalen Planung der Gewaesserqualitaet in Daenemark),
W76-12918 5G

Technical Manual for Estimating Low-Flow Frequency Characteristics of Streams in the Susquehanna River Basin,
W76-13086 4A

REGIONAL DEVELOPMENT
Wisconsin Annual Report 1975,
W76-12964 6B

REGRESSION ANALYSIS
Factors Influencing the Loss of Nitrogen and Phosphorus from a Tract of Irrigated Land,
W76-13014 5G

Technical Manual for Estimating Low-Flow Frequency Characteristics of Streams in the Susquehanna River Basin,
W76-13086 4A

REGULATION
Economic Evaluation of the Promulgated Interim Primary Drinking Water Regulations,
W76-12821 5G

Economic Evaluation of the Proposed Interim Primary Drinking Water Regulations,
W76-12822 5G

Latest U. S. Sewage Regulations,
W76-13057 5D

Operation and Impact of NPDES in Region II, Part 2,
W76-13059 5G

RELIABILITY
Estimating the Reliability of Advanced Waste Treatment,
W76-12904 5D

REMOTE SENSING
A Survey of New York Surface Water Temperatures. Aerial Infrared Surveys of Thermal Discharges from Electric Generating Stations into New York State Waters.
W76-12698 5B

Quantitative Relationship Between Reflectance and Transpiration of Phreatophytes--Gila River Test Site,
W76-12802 2D

Remote Sensing Study of Maumee River Effects on Lake Erie,
W76-12819 5A

The Coastal Plains Regional Commission--U.S. Geological Survey. Aeromagnetic-Aeroradioactivity Survey,
W76-13099 7B

An ERTS-1 Study of Coastal Features on the North Carolina Coast,
W76-13174 7B

Spectral Reflectance and Radiance Characteristics of Water Pollutants,
W76-13176 5A

Results of Soil Moisture Flights During April 1974,
W76-13178 2G

An Analysis of the Errors Associated with the Determination of Atmospheric Temperature from Atmospheric Pressure and Density Data,
W76-13179 2B

Broadband Spectral Photography of the James River,
W76-13180 5A

The Feasibility of Oil-Pollution Detection and Monitoring from Space: Examples Using ERTS-1 and Skylab Data,
W76-13181 5A

Basic Investigations for Remote Sensing of Coastal Areas,
W76-13182 2L

Basic Investigations for Remote Sensing of Coastal Areas,
W76-13183 2L

Applications of Remote Sensing to Estuarine Problems,
W76-13184 2L

Interdisciplinary Applications and Interpretation of EREP Data Within the Susquehanna River Basin,
W76-13188 7B

REPRODUCTION

Spawning of Lake Whitefish, Coregonus Clupeaformis, and Round Whitefish, Prosopium Cylindraceum, in Aishihik Lake and East Aishihik River, Yukon Territory,
W76-12754 2H

An Estimation of Total Production of Planktonic Copepods in Neritic Zone of the Golfe Dulion (Banyuls-Sur-Mer): I. Quantitative Annual Variation, (In French),
W76-12954 5C

Production of Pontogammarus Robustoides Grimm. In the Reservoir-Cooler of the Kurakhovian State Regional Electric Power Station, (In Russian),
W76-13200 5C

RESEARCH FACILITIES

Publications: Utah Water Research Laboratory.
W76-12730 10C

Great Lakes Research Division, Chronology of Research: 1950 to the Present.
W76-12815 2H

The Virginia Institute of Marine Science, Virginia's Marine Science, Engineering, Education, and Advisory Services Program,
W76-13100 6E

RESERVOIR EVAPORATION

Thermal Loading of Hyco Lake, North Carolina-- the Effect of Heated Water on Temperature and Evaporation, 1966-74,
W76-13078 5C

RESERVOIR SILTING

Efficiency of Nitrogen, Carbon, and Phosphorus Retention by Small Agricultural Reservoirs,
W76-12983 4D

RESERVOIR STORAGE

Comparison of Required Reservoir Storages Computed by the Thomas-Fiering Model and the 'Karlsruhe Model' Type A and B,
W76-12832 4A

RESERVOIR YIELD

Comparison of Required Reservoir Storages Computed by the Thomas-Fiering Model and the 'Karlsruhe Model' Type A and B,
W76-12832 4A

RESERVOIRS

Water Quality Investigations in a Small Artificial Reservoir,
W76-12943 5C

Some Ecological Aspects of the Cabora Bassa Dam,
W76-12945 6G

A Mathematical Model of the 'Reservoir' Type Designed for Flood-Wave Modelling and Forecasting,
W76-12979 2A

Preimpoundment Water Quality of Raystown Branch Juniata River and Six Tributary Streams, South-Central Pennsylvania,
W76-13065 5A

Dynamics of Number and Biomass of Planktonic Infusoria in Open Zones of Kremenchug Reservoir and Their Production and Role in Organic Matter Destruction, (In Russian),
W76-13141 2H

RESIDUALS DISCHARGE

Development of Residuals Management Strategies: An Executive Summary,
W76-13054 5G

RESIDUALS MANAGEMENT

Development of Residuals Management Strategies: An Executive Summary,
W76-13054 5G

RESINS

Isolating Organic Water Pollutants: XAD Resins Urethane Foams, Solvent Extraction,
W76-12873 5A

RESOURCE ALLOCATION

The Social and Economic Importance of the Caroni Swamp in Trinidad and Tabago,
W76-12952 6G

RESOURCES DEVELOPMENT

A Preliminary Assessment of the Environmental Vulnerability of Machias Bay, Maine to Oil Supertankers,
W76-13087 6G

The Potential Effects of Increasing Oil Tanker Size on Narragansett Bay. An Advisory Report to the Coastal Resources Management Council.
W76-13088 6G

Possible Effects of Construction and Operation of a Supertanker Terminal on the Marine Environment in the New York Bight,
W76-13089 6G

Onshore Impacts of Oil and Gas Development in Alaska, Volume I.
W76-13090 5G

Onshore Impacts of Oil and Gas Development in Alaska. Volume II. Methodology Appendices.
W76-13091 5G

The Development Criteria of the Preliminary Coastal Plan,
W76-13092 2L

Interdisciplinary Applications and Interpretation of EREP Data Within the Susquehanna River Basin,
W76-13188 7B

RESPIRATION

Mechanism of Death at High Temperatures in Helix and Patella,
W76-12746 5C

RETENTION

Urban Hydrology for Small Watersheds.
W76-13044 4C

RETURN FLOW

Reduced Irrigation Tailwater Runoff for Increased Water-Use Efficiency,
W76-13008 3F

RETURN (MONETARY)

The Economics of Recovery of Materials from Industrial Waste--A Case Study,
W76-12948 5D

REUSE SYSTEMS (IRRIGATION)

Irrigation Reuse Systems--A Proposed New ASAE Engineering Practice,
W76-13016 3C

REVERSE OSMOSIS

Fundamental Study on the Post Treatment of RO Permeates from Army Wastewaters,
W76-12851 5D

Ammonia Removal from Wastewaters: A Review of the State of the Art,
W76-12853 5D

Separator,
W76-13148 5F

System of Water Purification and Product Distribution,
W76-13151 5F

Novel Polymer Membranes for Reverse Osmosis,
W76-13153 5F

REVIEWS

Land Application of Wastewater, (Literature Review),

ROYAL RIVER (ME)
Flood Hazard Analyses: Royal River and Chandler Brook, Town of North Yarmouth, Maine.
W76-13053 4A

RUNOFF
Urban Runoff Pollution Control Program Overview: FY'76,
W76-12857 5G

Urban Stormwater Runoff: Determination of Volumes and Flowrates,
W76-12858 5B

Floodwater Retarding Structure Yield Impact,
W76-12978 4A

Methodology for the Selection and Application of Probability Models for the Simulation of Daily Rainfall and Runoff,
W76-12994 7A

Samplers for Monitoring Runoff Waters,
W76-13006 5A

Physical-Chemical Composition of Eroded Soil,
W76-13010 2J

Urban Hydrology for Small Watersheds.
W76-13044 4C

RUTHENIUM-106
The Conduct of Certain Long-Lived Isotopes in Rocks in the Case of Their Contamination with Nontechnical Effluents of the Atomic Electric Power Stations (AES), (In Russian),
W76-12908 5B

SAGINAW AQUIFER SYSTEM
A Hypothesis of Ion Filtration in a Potable-Water Aquifer System,
W76-12803 4B

SAGITTARIA
Edaphic Factors in Species and Ecotype Differentiation of Sagittaria,
W76-12739 2G

SALINE SOILS
Aspects of Soil Salinity and Sodicity in Relation to Irrigation and Reclamation,
W76-13126 3C

SALINE WATER INTRUSION
Water Quality Model of a Salt-Wedge Estuary,
W76-13063 5B

SALINITY
On the Coexistence of Scavengers on Shallow Sandy, Bottoms in Gullmar Fjord (Sweden), Adaptations to Substratum, Temperature, and Salinity,
W76-12704 5C

Some Current Directed Movements of Macrobrachium Acanthurus (Wiegmann 1836) (Decapoda, Palaemonidae) under Laboratory Conditions,
W76-12707 2L

Reproduction and Recruitment of the Brackish Water Clam Rangia Cuneata in the James River, Virginia,
W76-12728 5C

Osmoregulation in Trichocorixa Verticalis Interiores Sailer (Hemiptera, Corixidae) - An Inhabitant of Saskatchewan Saline Lakes, Canada,
W76-12733 5C

A Volumetric Temperature/Salinity Census for the Middle Atlantic Bight,
W76-12990 2L

Water Quality Model of a Salt-Wedge Estuary,
W76-13063 5B

SALMON
First Stages Towards Ranching Salmon on Ocean Ranges,
W76-12949 6B

Characteristics of the Primary Production in the Salmon Breeding Lake, (In Russian),
W76-13193 5C

SALMONELLA
Qualitative and Quantitative Salmonella Investigations and their Hygienic Valuation in Connection with E. Coli Titre, Demonstrated with Examples from the Coastal Waters of Kiel Bight (Western Baltic Sea), (In German),
W76-13140 5A

SALT MARSHES
Diatom Communities from a Delaware Salt Marsh,
W76-12734 5C

Diatom Communities from a Delaware Salt Marsh,
W76-13118 5C

SALTS
Dynamics of Salts SiO2, R2O3, MnO and Water-Soluble Organic Matter in Underground Water, (In Russian),
W76-13043 5B

SAMPLING
Design and Testing of a Prototype Automatic Sewer Sampling System,
W76-12872 5A

Continuous Monitoring, Automated Analysis, and Sampling Procedures, (Literature Review),
W76-12902 5A

Contribution on the Knowledge of the Organic in the Coastal Waters of the GDR: V. the Variability of the Chemical Oxygen Consumption at Selected Stations of the Waters in the Shallow Inlets to the South of the Zingst Peninsula During the Synoptic Investigation in 1972, (In German),
W76-12916 5B

Ultrasonic Removal of Epilithic Algae in a Barclamp Sampler,
W76-12939 5A

New Diver-Operated Bedload Sampler,
W76-12972 2J

Samplers for Monitoring Runoff Waters,
W76-13006 5A

Variation of Suspended Sediment Load in the Palouse Region of the Northwest,
W76-13012 5G

Describing Variance with a Simple Water Quality Model and Hypothetical Sampling Programs,
W76-13162 5B

The Continuous Aluminum-Foil Hydrometeor Sampler; Design, Operation, Data Analysis Precedures, and Operating Instructions,
W76-13173 2B

Zooplankton Populations in the 'Water-Sportbaan Georges Nachez' at Ghent in 1972, A Year of Continuous Waterblooming, (In Flemish),
W76-13196 5C

SANDS
Seasonal Variations in the Purification of Treatment Plant Effluent in Natural Sand Deposits,
W76-13121 5D

SANTA BARBARA CHANNEL
Energy Development: The Environmental Tradeoffs. Volume 3: Relative Environmental Ranking of Proposed Offshore Continental Shelf Areas on the Basis of Impacts of Oil Spills,
W76-13039 6G

SANTA MONICA BAY (CALIF)
Fate of Metals in Wastewater Discharge to Ocean,
W76-12927 5B

SAPROBIC INDEX
A Simplified Method for the Biological Assessment of The Quality of Fresh and Slightly Brackish Water,
W76-13115 5A

SAPROBIC LEVELS
Example for Regional Planning of Water Quality in Denmark (Beispiel Einer Regionalen Planung der Gewaesserqualitaet in Daenemark),
W76-12918 5G

SAPROPHYTES
Effect of the Operating Conditions of Recycling Water Supply Systems on the Quality of Reused Waste Waters, (In Russian),
W76-12907 5C

SARGASSO SEA
Skeletonema Menzelii Sp. Nov., A New Diatom from the Western Atlantic Ocean,
W76-12766 2L

SATURATED FLOW
Finite-Difference Model for Aquifer Simulation in Two Dimensions with Results of Numerical Experiments,
W76-13085 2F

SATURATED SOILS
Solute Dispersion in Saturated Soil Columns,
W76-12986 5B

SATURATION
Ground Water Movement,
W76-13031 4B

SCALE ANALYSIS
Annulus Formation and Growth of Tigerfish, Hydrocynus Vittatus, in Lake Bangweulu, Zambia,
W76-12767 5C

SCALING
Apparatus for the Prevention of Scaling in Desalination Apparatus,
W76-13154 3A

SCAVENGERS
On the Coexistence of Scavengers on Shallow Sandy, Bottoms in Gullmar Fjord (Sweden), Adaptations to Substratum, Temperature, and Salinity,
W76-12704 5C

SCENEDESMUS
The Influence of Gibberellic Acid and Kinetin on the Growth of Scenedesmus Quadricauda (Turp.) Breb.,
W76-12941 5C

Changes in the Reactivity of the Photosynthetic Apparatus in Heterotrophic Ageing Cultures of Scenedesmus Obliquus. I. Changes in the Photochemical Activities,
W76-13109 5C

Changes in the Reactivity of the Photosynthet
Apparatus in Heterotophic Ageing Cultures
Scenedesmus Obliquus. II. Changes in Ultra
tructure and Pigment Composition,
W76-13110 5

Changes in the Reactivity of the Photosynthet
Apparatus in Heterotrophic Ageing Cultures
Scenedesmus Obliquus. III. Recovery of t
Photosynthetic Capacity in Aged Cells,
W76-13111 5

SCHEDULING
Irrigation Scheduling and Sugarbeet Produ
tion,
W76-13002 3

Plant Water Stress Criteria for Irrigati
Scheduling,
W76-13024 3

SCIOTO RIVER (OH)
Flood Plain Information: Scioto and Olentan
Rivers, Ohio, Chillicothe Area Summary R
port,
W76-13046 4

SCREEN SELECTION
Engineered Irrigation Wells.
W76-13033 4

SEA WATER
Chemistry of Halogens in Seawater,
W76-12884 5

Surface Water Temperatures at Shore Statio
United States West Coast, 1973.
W76-12995 2

Concentrations of Mercury, Cadmium, Le
and Copper in the Surrounding Seawater and
Seaweeds, Undaria Pinnatifida and Sargass
Fulvellum, from Suyeong Bay in Pusan,
Korean),
W76-13190 5

SEAFOOD INDUSTRIAL PARKS
Seafood Processing in Relation to Coastal
dustrial Park Concepts,
W76-13101 6

SEAFOOD PROCESSING WASTES
Waste Disposal in Seafood Processing: Pub
or Private,
W76-13102 5

SEASHORES
Legal Aspects of Public Access to Beaches,
W76-13104 6

Back Bay National Wildlife Refuge. So
Parallels in Implementing the Coastal Za
Management Act,
W76-13105 6

SEASONAL
Seasonal Variations in the Purification
Treatment Plant Effluent in Natural Sa
Deposits,
W76-13121 5

SEAWEEDS
Concentrations of Mercury, Cadmium, Le
and Copper in the Surrounding Seawater and
Seaweeds, Undaria Pinnatifida and Sargass
Fulvellum, from Suyeong Bay in Pusan,
Korean),
W76-13190 5

SECONDARY PRODUCTIVITY
Lake George Site Synthesis, 1974-1975.
W76-12937 2

DIMENT DISCHARGE
New Diver-Operated Bedload Sampler,
W76-12972 2J

Sediment from Drainage Systems for a Heavy Soil,
W76-13001 3F

DIMENT DISTRIBUTION
Sublacustrine Fan Morphology in Lake Superior,
W76-13079 5B

DIMENT FLUSHING
Sediment Flushing After Dredging in Tidal Bays,
W76-12974 8C

DIMENT LOAD
Sediment from Drainage Systems for a Heavy Soil,
W76-13001 3F

Variation of Suspended Sediment Load in the Palouse Region of the Northwest,
W76-13012 5G

Suspended Sediment and Turbidity in Irrigation Return Flows - A Prototype Study,
W76-13017 5B

DIMENT TRANSPORT
Studies of Columbia River Water Quality Development of Mathematical Models for Sediment and Radionuclide Transport Analysis,
W76-12702 5B

A Brief Hydrologic Appraisal of the July 3-4, 1975, Flash Flood in Las Vegas Valley, Nevada.
W76-12806 4A

Erosion and Transport of Bed-Load Sediment,
W76-12827 2J

Sediment from Drainage Systems for a Heavy Soil,
W76-13001 3F

DIMENT YIELD
Sediment from Drainage Systems for a Heavy Soil,
W76-13001 3F

Variation of Suspended Sediment Load in the Palouse Region of the Northwest,
W76-13012 5G

DIMENTATION
Sediment Flushing After Dredging in Tidal Bays,
W76-12974 8C

IMENTATION RATES
Sublacustrine Fan Morphology in Lake Superior,
W76-13079 5B

IMENTS
Geochemical Controls on Lead Concentrations in Stream Water and Sediments,
W76-12800 5A

Emission of Sulfur from Lake Ontario Sediments,
W76-12987 2J

MIC STUDIES
Groundwater Geophysics in South Africa,
W76-13027 4B

SELECTIVE LEVEL RELEASES
Selective Withdrawal Criteria of Stratified Fluids,
W76-12970 8B

SELENASTRUM CAPRICORNUTUM
Effects of Temperature on Oil Refinery Waste Toxicity,
W76-12711 5C

SEPARATION TECHNIQUES
An Evaluation of Two Hydrograph Separation Methods of Potential Use in Regional Water Quality Assessment,
W76-12691 5G

Improved Liquid-Solids Separation by an Aluminum Compound in Activated Sludge Treatment,
W76-12867 5D

Isolating Organic Water Pollutants: XAD Resins Urethane Foams, Solvent Extraction,
W76-12873 5A

Separator,
W76-13148 5F

SEWAGE
An Assessment of the Airborne Emission of Selected Viruses by Wastewater Treatment Facilities,
W76-12678 5A

Design and Testing of a Prototype Automatic Sewer Sampling System,
W76-12872 5A

SEWAGE TREATMENT
Sludge Processing, Transportation and Disposal/Resource Recovery: A Planning Perspective,
W76-12683 5D

Meadow/Marsh Systems as Sewage Treatment Plants,
W76-12753 5D

Urban Runoff Pollution Control Program Overview: FY'76,
W76-12857 5G

Raw Sewage Coagulation and Aerobic Sludge Digestion,
W76-12859 5D

Economical Residential Pressure Sewer System with No Effluent,
W76-12861 5D

Ultraviolet Disinfection of Activated Sludge Effluent Discharging to Shellfish Waters,
W76-12862 5D

Tertiary Treatment for Phosphorus Removal at Ely, Minnesota Awt Plant, April, 1973 thru March, 1974.
W76-12863 5D

Review and Evaluation of Available Techniques for Deterimining Persistence and Routes of Degradation of Chemical Substances in the Enviroment,
W76-12865 5A

Current Chlorination and Dechlorination Practices in the Treatment of Potable Water, Wastewater, and Cooling Water,
W76-12877 5D

Chlorination of Organics in Cooling Waters and Process Effluents,
W76-12882 5A

Chlorinated Compounds Found in Waste-Treatment Effluents and Their Capacity to Bioaccumulate,
W76-12891 5A

NASA To Test New Techniques For On-Stream Water Monitoring.
W76-12900 5A

Mogden, Where Sewage Works,

LIBRARY OF THE UNIVERSITY OF CALIFORNIA
SANTA CRUZ

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

LIBRARY U. OF I. URBANA-CHAMPAIGN

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

1 NATURE OF WATER

2 WATER CYCLE

3 WATER SUPPLY AUGMENTATION AND CONSERVATION

4 WATER QUANTITY MANAGEMENT AND CONTROL

5 WATER QUALITY MANAGEMENT AND PROTECTION

6 WATER RESOURCES PLANNING

7 RESOURCES DATA

8 ENGINEERING WORKS

9 MANPOWER, GRANTS, AND FACILITIES

10 SCIENTIFIC AND TECHNICAL INFORMATION
